INTRODUCTION

This bibliography contains citations, abstracts and author, corporate source, subject, contract, and title indexes for all U. S. Environmental Protection Agency and its predecessor agencies' reports contained in the NTIS collection as of April 1, 1973. A supplement will be issued in February, 1974 to include older reports which will be identified and included in NTIS during the remainder of the calendar year, as well as all new reports issued by the EPA during this time period.

The bibliography should provide sufficient information for any user to identify any EPA report desired. Copies of the individual reports will be available from NTIS in either hard copy or on microfiche. NTIS will also provide the EPA reports in microfiche as a set; cost figures may be obtained from that office.

EPA libraries contain complete sets of microfiche on all items included in this bibliography. In addition, a complete set has been made available to 25 foreign countries which now have, or are contemplating, the establishment of an environmental agency.

EPA REPORTS BIBLIOGRAPHY

AD-607 953
Southwestern Radiological Health Lab., Las Vegas, Nev.
OFF-SITE SURVEILLANCE.
Final rept.,
George W. Niles. 1 Sep 64, 36p ARPA-VUF1009

Descriptors: (*Nuclear explosions, *Radioactive contaminants).
Identifiers: *Shoal Operation.

Project Shoal, which took place at a location near Fallon, Nevada on October 26, 1963 at 1000 PDT, was an underground nuclear detonation conducted as a part of the Vela program of the Department of Defense. The Off-Site Radiological Safety Program of the U. S. Public Health Service's Southwestern Radiological Health Laboratory monitored the public area surrounding the site and collected and analyzed several hundred water, milk and air samples before and for several weeks after the event. (Author Modified Abstract)

AD-729 582
Eastern Environmental Radiation Lab Montgomery Ala
INVESTIGATION OF TRITIATED LUMINOUS COMPOUNDS.
Technical rept.,
Stephen L. Kaufman, Mayme C. Colvin, Robert Lieberman, A. A. Moghissi, and Blair F. Rehnberg. Jun 71, 21p* Rept no. EERL-71-2

Descriptors: (*Tritium, *Metabolism), (*Phosphorescent materials, Metabolism), (*Radiation effects, Phosphorescent materials), Absorption (Biological), Tracer studies, In vivo analysis, Public health, Rats, Mammals, Half life, Skin, Gastrointestinal system.

The cutaneous and gastrointestinal tract absorption of four tritiated luminous compounds was studied in experimental animals. The percent absorption of the individual compounds via the cutaneous route varied from 0.10 to 8.83 percent and via the gastro-intestinal route from 0.67 to 21.55 percent. The data show a positive correlation between the relative absorption of the individual luminous compounds through both the cutaneous and gastrointestinal routes. Tritium activity was eliminated in two components. A slow component was seen to represent tritium activity in the form of tritiated water (HTO), while a more rapid component was thought to be tritium incorporated in other compounds soluble in urine and other body fluids. COMPOSTING OF ORGANIC WASTES, AN ANNOTATED BIBLIOGRAPHY. SUPPLEMENT 1,
John S. Wiley. Jun 59, 65p
See also PB-147 219 and PB-148 097.

Descriptors: (*Composts, *Bibliographies), (*Waste disposal, Composts).
Identifiers: *Solid waste disposal.

The initial 1958 bibliography was well received and immediately brought forward numerous additional articles, largely foreign, on the subject of composting. These and other articles brought to the editor's attention have been abstracted and are included in this supplement, which is undoubtedly far from complete.

PB-148 097
Communicable Disease Center, Atlanta, Ga.
COMPOSTING OF ORGANIC WASTES. AN ANNOTATED BIBLIOGRAPHY. SUPPLEMENT 2,
John S. Wiley. Apr 60, 66p
See also PB-147 220.

Descriptors: (*Composts, *Bibliographies), (*Waste disposal, Composts).
Identifiers: *Solid waste disposal.

A third bibliography on composting supplements the initial one, published in 1958 and the first supplement, published in 1959. As before, numerous articles on this subject have appeared in the short interval since the last issue, largely foreign, for there is still more activity in both research and in plant installations in Europe than in America.

POTENTIAL DISPERSION OF PLUMES FROM LARGE POWER PLANTS,
Francis Pooler, Jr. 1965, 17p PHS-Pub-999-AP-16
Rept. on Environmental Health Series. Air Pollution.

Descriptors: (*Power plants (Establishments), Waste gases), (*Waste gases, Scattering), (*Air pollution, Power plants (Establishments)), Concentration (Chemistry), Meteorological parameters, Numerical analysis.

Expected ground-level concentrations resulting from emissions from large power plants are discussed for three meteorological situations considered to be most likely to result in significant air pollution concentrations. These situations are (1) high wind; (2) inversion breakup; and (3) limited mixing layer with a light wind. Effects of increasing stack height are discussed for each situation. Numerical examples based on calculations included as an appendix are shown. (Author)

CONTINUOUS AIR MONITORING PROGRAM IN CINCINNATI, 1962-1963.
Jan 65, 189p PHS-Pub-999-AP-21
Rept. on CAMP.

Descriptors: (*Public health, Air pollution), (*Air pollution, Ohio), Monitors, Sulfur compounds, Dioxides, Nitrogen compounds, Oxides, Oxidizers, Hydrocarbons, Carbon monoxide, Urban areas, Instrumentation, Tables.
Identifiers: CAMP.

The report presents results of the operation of the Public Health Service Continuous Air Monitoring Program (CAMP) in Cincinnati, Ohio, during 1962 and 1963. Data on atmospheric levels of sulfur dioxide, nitric oxide, nitrogen dioxide, total oxidants, total hydrocarbons, and carbon monoxide are analyzed and discussed. The data are tabulated as hourly, daily, and monthly mean concentrations. Background information about Cincinnati and descriptions of the instrumentation are included. (Author)

METHODS OF MEASURING AND MONITORING ATMOSPHERIC SULFUR DIOXIDE,
Seymour Hochheiser. Aug 64, 54p PHS-Pub-999-AP-6

Descriptors: (*Public health, Air pollution), (*Air pollution, Sulfur compounds), Diodes, Monitors, Measurement, Sampling, Instrumentation, Specifications, Test methods.

A literature review of methodology relating to the measurement of atmospheric sulfur dioxide, a detailed description of recommended methods, and criteria for selection of recommended methods are presented in this report. This publication is intended to serve as a resource document for those involved in measurement of pollution and in research on new or improved methods, and for those who seek to bring about widespread agreement in matters concerning measurement of pollution. A STUDY OF AIR POLLUTION IN THE INTERSTATE REGION OF LEWISTON, IDAHO, AND CLARKSTON, WASHINGTON.
Dec 64, 167p PHS-Pub-999-AP-8

Descriptors: (*Idaho, Air pollution), (*Washington (State), Air pollution), Waste gases, Meteorological parameters, Sulfur compounds, Odors, Wastes (Industrial), Public opinion, Law.

The purpose of the study was to determine the nature and extent of air pollution in the Lewiston-Clarkston area and to assemble information to be used as a basis for technical and official action needed to conserve air quality in the area. Because of its unique valley location, the two-city area is susceptible to meteorological conditions conductive to pollutant accumulation. Either city contaminate the other, and this creates a multijurisdictional problem that requires joint and cooperative action to control air pollution. As a first step to solve the problem, an Air Resources Management Council consisting of county, city and state officials is to be organized. This council will be responsible for planning surveys and studies to determine air quality guides and legislation and administration necessary to control air pollution in this multijurisdictional area. The Public Health Service in its advisory capacity will provide technical assistance. (Author)

AIR POLLUTION ASPECTS OF THE IRON AND STEEL INDUSTRY,
Jean J. Schueneman, M. D. High and W. E. Bye.Jun 63, 128p PHS-Pub-999-AP-1
Rept. on Environmental Health Series. Air Pollution.

Descriptors: (*Iron industry, Air pollution), (*Air pollution, Iron industry), Manufacturing methods, Furnaces, Waste gases, Control, Sintering, Public health, Law.

The report is a summary of published and other information on the air pollution aspects of the iron and steel industry, including coke plants incident thereto. Processes, equipment, and raw materials are briefly described. The magnitude and location of plants and process trends are noted. Air pollutant emissions and means for their control are discussed in detail, with respect to sintering; coke production; blast furnaces; open hearth, Besemer, electric, and basic oxygen steelmaking furnaces; and other operations. The effects of pollutants on community air quality are described, and knowledge of health aspects of pollutants is summarized. Laws regulating pollutant emissions are given, and control equipment and measures needed to comply with certain laws are listed. (Author)

ATMOSPHERIC EMISSIONS FROM FUEL OIL COMBUSTION; AN INVENTORY GUIDE,
Walter S. Smith. Nov 62, 103p PHS-Pub-999-AP-2
Rept. on Environmental Health Series. Air Pollution.

Descriptors: (*Public health, Air pollution), (*Air pollution, Fuel oil), (*Fuel oil, Air pollution), Combustion, Combustion products, Smokes, Nitrogen compounds, Oxides, Sulfur compounds, Dioxides, Particle size, Reviews.

The review provides a guide for the inventorying and control of emissions arising from the combustion of fuel oil. Information was collected from the published literature and other sources. The report is limited to information on oil used as a source of heat or power (exclusive of process heaters). The data were abstracted, assembled, and converted to common units of expression to facilitate understanding. From these data, emission factors were established that can be applied to fuel oil combustion to determine the magnitude of air-contaminating emissions. Also discussed are the compositions of fuel oils; the preparation and combustion of fuel oil; and the rates of emission, their variables, and their control. (Author)

COMMUNITY PERCEPTION OF AIR QUALITY: AN OPINION SURVEY IN CLARKSTON, WASHINGTON,
Nahum Z. Medalia and A. L. Finkner. Jun 65, 115p PHS-Pub-999-AP-10
Rept. on Environmental Health Series. Air Pollution.

Descriptors: (*Air pollution, Public opinion), Damage, Buildings, Paints, Urban areas, Odors, Public health, Attitudes, Washington (State).

In a community with a population of 7,000 and located approximately 4 miles downwind from a pulp mill, a public opinion survey was taken to analyze the environmental stress of air pollution on a sample of household heads and spouses, along two principal attitudinal dimensions: awareness and concern. Of those interviewed, 91 percent perceived air pollution in the community as a malodor problem; 74 percent perceived it as a problem of visibility; and 62 percent as a problem of nose-throat irritation. A Guttman-type scale showed high concern with air pollution among 48 percent of the sample; low to moderate concern among 31 percent; and minimal concern among 21 percent. Although exposure to odorous pollutants in ambient air appeared roughly equal for all members of the sample, their concern with air pollution was found to vary directly with social status and attitude characteristics such as civic pride, desire to ameliorate the situation, length of residence in the community, and occupational prestige of the household head. Public Health Service, Cincinnati, Ohio. Div. of Air Pollution.
AIR POLLUTION IN THE COFFEE ROASTING INDUSTRY,
Frank Partee. Sep 64, 20p PHS-Pub-999-AP-9
Rept. on Environmental Health Series.

Descriptors: (*Air pollution, Industries), (*Public health, Air pollution), (*Coffee, Processing), Emissivity, Dust, Odors, Smokes, Urban areas, Control.

The review provides a guide for the inventorying and control of emissions arising from coffee processing. Information was collected from published literature and other sources. Emission factors were established for the various processes involved, i.e. roasting, stoning, and cooling. The air pollution aspects of the production of regular grades, instant, and decaffeinated coffee are discussed. Also discussed are the types and operating characteristics of control equipment used. DYNAMIC IRRADIATION CHAMBER TESTS OF AUTOMOTIVE EXHAUST,
Merrill W. Korth. Nov 63, 55p PHS-Pub-999-AP-5
Rept. on Environmental Health Series. Air Pollution.

Descriptors: (*Exhaust gases, Radiation damage), (*Air pollution, Exhaust gases), Density, Exhaust systems, Test facilities, Passenger vehicles, Radiation effects, Bacteria, Plants (Botany), Animals, Fuels.

As part of an intensive study by government and private agencies the U. S. Public Health Service has built an irradiation chamber facility for investigation of irradiated auto exhaust under mixing conditions similar to those in the atmosphere. The facility consists of a programmed continuous-cycling chassis dynamometer, an exhaust dilution system, a dilution-air purification system, two irradiation chambers, and exposure facilities for evaluation of bacteria kill, plant damage, and various effects on small animals. Of the three variables studied during the first test series, the exhaust concentration at the start of irradiation appeared to produce the most significant effects. Fuel composition had a lesser influence. Very little difference was noted in the effects produced at two different average irradiation times. (Author)

PB-168 878

THE NOVEMBER-DECEMBER 1962 AIR POLLUTION EPISODE IN THE EASTERN UNITED STATES,
D. A. Lynn, B. J. Steigerwald and J. H. Ludwig.Sep 64, 30p PHS-Pub-999-AP-7
Rept. on Environmental Health Series. Air Pollution.

Descriptors: (*Air pollution, United States), Meteorological parameters, Urban areas, Public health, Gases, Contamination, Anticyclones, Atmospheric motion, Sampling.

The report documents the subject 'episode' with respect to meteorology, air quality, and public reaction. Particulate and gaseous air quality data are reported and discussed. Meteorology and public reaction are discussed with reference to the Public Health Service program of Air Pollution Potential Forecasts. Epidemiological aspects are not considered. (Author)

PB-168 879
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
REACTIVITY OF ORGANIC SUBSTANCES IN ATMOSPHERIC PHOTOOXIDATION REACTIONS,
A. P. Altshuller. Jul 65, 29p PHS-Pub-999-AP-14
Rept. on Environmental Health Series. Air Pollution.

Descriptors: (*Exhaust gases, Oxidation), (*Air pollution, Organic compounds), (*Photochemistry, Organic compounds), Waste gases, Control, Toxicity, Gas analysis, Hydrocarbons, Nitrogen compounds, Oxides, Aldehydes, Ketones, Aerosols, Plants (Botany).

The organic vapors emitted to urban atmospheres by motor vehicles and other sources of emissions consist not only of paraffinic, acetylenic, aromatic, and olefinic hydrocarbons, but also of aldehydes, ketones, alcohols, phenols, and chlorinated hydrocarbons. To estimate the contribution of each of these classes of compounds to photochemical smog, one must know both their atmospheric concentrations and their relative reactivities in atmospheric reactions. Reactivities of organic substances in photooxidation reactions can be considered from many standpoints. Rates of disappearance of the organic substances, rates of disappearance of nitric oxide or of formation and disappearance of nitrogen dioxide, and rates or maximum yields of various products such as oxidant or organic nitrates all can be used as chemical measurements of reactivity. Eye irritation, various types of plant damage, and aerosol formation are indicators of reactivity that can be related only to a limited extent to chemical measurements of reactivity. The problems of developing a single index of reactivity are considered. The application of reactivity measurements to automobile exhaust composition, to control devices, and to improvements in atmospheric purity is discussed. (Author)

Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
A PILOT STUDY OF AIR POLLUTION IN JACKSONVILLE, FLORIDA,
James P. Sheehy, John J. Henderson, Charles I. Harding and Anthony L. Danis. Apr 63, 65p PHS-Pub-999-AP-3

Descriptors: (*Air pollution, Florida), (*Public health, Air pollution), Urban areas, Fluorides, Sulfur compounds, Dioxides, Hydrogen compounds, Sulfides, Hydrocarbons, Nitrogen compounds, Oxides, Carbon dioxide, Carbon monoxide, Aldehydes, Ketones, Meteorological parameters, Damage.

The objectives of this pilot study were to develop a preliminary evaluation of air pollution in Jacksonville and to determine whether fluoride and sulfur dioxide concentrations were sufficient to cause damage to vegetation that had occurred in the area. The study consisted of an emission inventory, a meteorological investigation, an intensive short-term study of downtown Jacksonville, and an industrial area study. Pollutants sampled for included sulfur dioxide, oxidants, nitrogen dioxide, carbon monoxide, hydrogen sulfide, fluorides, and suspended particulates. During the study fluoride concentrations were high enough in certain parts of the city to cause damage to sensitive plants; sulfur dioxide and oxidants were also present at significant levels. Results of the study also indicated that photochemical smog is produced over Jacksonville, that pollutants from Jacksonville are transported across the St. John's River, and finally, that several pollutants constitute a potential problem in the city and should be evaluated further. STUDIES OF THE FATE OF CERTAIN RADIONUCLIDES IN ESTUARINE AND OTHER AQUATIC ENVIRONMENTS.
Environmental health series,
Julius J. Sabo and Paul H. Bedrosian. May 63, 85p PHS-Pub-999-R-3

Descriptors: (*Radioactive waste, Rivers), (*Marine biology, Radioactive waste), (*Estuaries, Radiological contamination), Radioactive isotopes, Rivers, Radiation effects, Ecology, Health physics, Health physics instrumentation, Hydrodynamics, Silt, Sedimentation, Salinity, Radiation monitors, Symposia.

In a symposium on the fate of radionuclides in the Savannah River Estuary and in two river systems, procedures are described which can usefully be applied to investigations of other aquatic systems. The studies involve surveillance and monitoring techniques and the development of equipment and methods. A discussion of the hydraulics of the Savannah Estuary describes the characteristics of river and tidal currents and distribution of salinity and sedimentation; these form a basis for effective sampling and interpretation of radiological data and their application to aquatic and ecological data and their application to aquatic and ecological studies. Field and laboratory studies on the accumulation of nuclides by organisms are described and interrelated. It is shown that more useful information can be developed when specific nuclides, rather than gross activity, are investigated. Improvements in sampling methods, especially in silt collection, are described in detail. These studies emphasize the multidisciplinary aspects of radiological surveys of aquatic environments. Minnesota Univ., Minneapolis.
FACTORS INFLUENCING STRONTIUM-90 IN MILK FROM THE BRAINERD, MINN. MILKSHED.
Environmental health series.
Dec 62, 77p PHS-Pub-999-R-1
Prepared in cooperation with Minnesota Dept. of Health.

Descriptors: (*Milk, Radiological contamination), (*Radiological contamination, Milk), (*Strontium, Radiological contamination), Radioactive isotopes, Soils, Minnesota, Bovines, Grasses, Agriculture, Radioactive fallout, Rainfall, Health physics.

A study was undertaken to investigate consistent farm-to-farm differences in the concentrations of strontium-90 found in milk produced within a small milkshed in central Minnesota. Covering an 8-month period, the study included sampling of milk, hay, grain, silage, water, forage, soil, and precipitation. The data indicate that 70 to 90 percent of the cattle's strontium-90 intake came from the native grass hay and that the farm-to-farm differences of strontium-90 concentrations in milk correspond to similar differences of strontium-90 concentrations in the hay fed. On the basis of the data obtained, it is not possible to explain why the consistent differences in the native grass hay existed. (Author)

PROCEDURES FOR DETERMINATION OF STABLE ELEMENTS AND RADIONUCLIDES IN ENVIRONMENTAL SAMPLES.
Environmental health series,
C. R. Porter, R. J. Augustine, J. M. Matusek, Jr., and M. W. Carter. Jan 65, 91p PHS-Pub-999-RH-10

Descriptors: (*Radiochemistry, Radiological contamination), (*Health physics, Test methods), Instruction manuals, Chemical analysis, Radiation monitors, Radioactive isotopes, Radioactive decay, Radiation measurement systems, Food, Milk, Silt, Soils, Water, Radiobiology, Plants (Botany), Animals.

This is a manual of methods used at the Public Health Service's Southeastern Radiological Health Laboratory for the determination of stable elements and radionuclides in environmental samples. The procedures are intended for use in the processing of relatively large numbers of samples in a minimum of time for environmental radiological surveillance. The manual is divided into sections on: milk; food, biota, silt, and soil; water, and counting procedures. Appendixes cover preparation of reagents and tables of selected radionuclide decay and ingrowth factors. (Author)

PB-169 677
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
SELECTED METHODS FOR THE MEASUREMENT OF AIR POLLUTANTS.
May 65, 55p PHS-Pub-999-AP-11

Descriptors: (*Air pollution, Monitors), (*Gas analysis, Air pollution), (*Public health, Air pollution), Waste gases, Atmosphere, Chemical analysis, State-of-the-art reviews, Sanitary engineering.

This manual is an effort to assist in the development of uniform standard methods of analysis of air pollutants. It makes available the judgment and knowledge of a large group of chemists in the Public Health Service. Methods of determining pollutants of common interest are presented in uniform format by chemists on the staff of the Division of Air Pollution. The methods were critically reviewed by the Interbranch Chemical Advisory Committee, which is composed of representatives of the professional chemical groups in all branches of the Division. Methods presented are as follows: For determination of sulfur dioxide, the West and Gaeke and the hydrogen peroxide methods; for determination of nitrogen dioxide and nitric oxide, the Saltzman method; for determination of oxidants, the neutral buffered-potassium iodide and the alkaline potassium iodide methods; for determination of aliphatic aldehydes, the 3-methyl-2 benzothiazolone hydrazone hydrochloride method; for determination of acrolein, the 4-hexylresorcinol method; for determination of formaldehyde, the chromotropic acid method; for determination of sulfate in atmospheric suspended particulates, the turbidimetric barium sulfate method; and for determination of nitrate in atmospheric suspended particulates, the 2, 4 xylenol method. THE TREND OF SUSPENDED PARTICULATES IN URBAN AIR: 1957-1964.
Environmental health series.
T. B. McMullen, and R. Smith. Sep 65, 28p PHS-Pub-999-AP-19

Descriptors: (*Air pollution, Particles), (*Dust, Density), Samplers, Collecting methods, Statistical analysis, Environment, Urban areas, Meteorological parameters.

The trend toward lower average concentrations of suspended particulate pollution in the urban air in the United States from 1957 through 1963, indicated by measurements of the National Air Sampling Network, is investigated from three aspects: (1) statistical significance, (2) the validity of the sampling and analytical methods, and (3) relationship to environmental changes in the vicinity of the sampling stations. The evidence indicates that the decline is real and that the methods employed can reliably detect substantive changes in the concentration of suspended particulate pollution. Information on changes in the environments of a representative group of stations revealed that where significant decreases in suspended particulates occurred, they were often logically related to specific changes in source emissions. Thus the indicated decline in the suspended particulate portion of urban air pollution is verified and substantially accounted for. A statistically significant increase in the annual mean occurred in 1964; if continued, such an increase would suggest the possibility of cyclic influences. (Author)

PB-170 701

AIR PARTICULATES NO. 1 STUDY NUMBER 22.
James S. Ferguson, Ronald T. Cope, and Earl F. McFarren. 1965, 85p PHSP-999-AP-22

Descriptors: (*Air pollution, Particles), (*Particles, Visual inspection), Atmosphere, Dust, Microscopes, Identification.

In the study, 35 participants each analyzed 10 slides of selected air particulates permanently mounted in a solid plasticizer. Slides 1 through 7 contained a single particulate, while slides 8 and 9 contained three each, and slide 10 contained 9 particulates. Of 770 possible correct identifications that could be made by the 35 participants analyzing the 10 slides, 247 correct identifications were made. Among the participants identifying these particulates, those using a polarizing microscope and a range of magnifications did better than those not doing so. Whereas most of the participants did reasonably well in estimating the size of the particulate on slide number 2, most did very poorly in estimating the percent by weight of each component on slides 8, 9, and 10. Although no text or standard method on identification of atmospheric particulates exists, the overall results of the study were very good. (Author)

SURVEY OF LEAD IN THE ATMOSPHERE OF THREE URBAN COMMUNITIES.
Jan 65, 99p PHS-Pub-99-AP-12
Availability: Hard copy available from Superintendent of Documents, GPO, Washington, D. C. 20402, $0.60.

Descriptors: (*Urban areas, Air pollution), (*Air pollution, Lead compounds), (*Lead compounds, Air pollution), Fuel additives, Metalorganic compounds, Combustion products, Concentration (Chemistry), Samplers, Diurnal variations, Blood, Urine, Lead, Particles, Ohio, California, Pennsylvania.

A study of the concentrations of lead in the atmospheres of Cincinnati, Los Angeles, and Philadelphia was conducted jointly by industrial, State, Federal, and university groups during the period June 1961 through May 1962. In each city, from four to eight sampling stations, representing four geographical and land-use classifications (rural, residential, commercial, and industrial) were operated continuously with membrane filter samplers. In addition, at one station of each classification in each city, diurnal variations were investigated by use of sequential tape samplers. In each city samples of blood and urine were obtained from selected groups of residents and examined for concentrations of lead. All samples were analyzed by the dithizone method. Approximately 3,400 samples of particulate lead from the atmosphere were obtained, and the concentrations of lead in blood of approximately 2,300 individuals and of lead in urine of 1,700 males were determined. Details of the study and the results obtained are reported. (Author)

AN AIR RESOURCE MANAGEMENT PLAN FOR THE NASHVILLE METROPOLITAN AREA.
James D. Williams, and Norman G. Edmisten. Sep 65, 154p PHS-Pub-999-AP-18

Descriptors: (*Air pollution, Tennessee), (*Natural resources, Air), (*Tennessee, Air pollution), Waste gases, Control, Management planning, Combustion products, Measurement, Samplers, Diffusion, Meteorology, Mathematical models, Public opinion.

The report is based on the numerous technical and scientific papers resulting from a major study of air pollution and effects made in Nashville, Tennessee, by the Public Health Service, Vanderbilt University, and state and local agencies during 1958-59. These papers have been supplemented by field investigations to complete the background information needed for preparation of an air resource management program plan. The report summarizes a number of the technical and scientific papers and uses all of them to develop new concepts as well as unify new and old approaches to air pollution control in preparation of the air resource management program plan. Air quality goals and the means to reach those goals are suggested. Supporting data are provided and methodology adapted for relating air quality goals to control of emissions. Methods for predicting air pollutant levels by use of mathematical models are presented. Public opinion survey results and their implications for the air resource management program are given. The report has specific use for development of an air resource management program in Nashville and general use for program development and reference in many other places. (Author)

AIR POLLUTION AND THE KRAFT PULPING INDUSTRY. AN ANNOTATED BIBLIOGRAPHY.
Paul A. Kenline, and Jeremy M. Hales. Nov 63, 124p PHS-Pub-999-AP-4

Descriptors: (*Paper industry, Air pollution), (*Air pollution, Paper industry), (*Wood pulp, Odors), Bibliographies, Abstracts, State-of-the-art reviews, Waste gases, Sulfates, Control systems, Processing.

Since the first kraft mill came into existence in 1891, the potential odor problem has been well recognized. Accordingly, a great deal of literature has been published describing practical and theoretical work in the field of kraft mill odor control. Some progress has been made, but even today most kraft mills are faced with serious problems of atmospheric pollution. An annotated bibliography is provided of articles concerning measurement and control of kraft mill air-borne pollution currently available in the literature. It is intended that this should provide a retrospective view of what has been accomplished and should form a sound basis for further work in the field. In addition to 154 abstracts, this bibliography contains a description of the kraft pulping process, a survey of mill emissions, and a consideration of control measures. (Author)

ATMOSPHERIC EMISSIONS FROM COAL COMBUSTION AN INVENTORY GUIDE.
W. S. Smith, and C. W. Gruber. Apr 66, 114p PHS-Pub-999-AP-24
Rept. on Environmental Health Series, Air Pollution.

Descriptors: (*Air pollution, Coal), (*Coal, Combustion), Smokes, Particles, Particle size, Gases, Sulfur compounds, Nitrogen compounds, Oxides, Dioxides, Furnaces, Chemical properties, Physical properties.
Identifiers: Sulfur dioxide, Sulfur trioxide, Nitrogen oxides.

Information concerning atmospheric emissions arising from the combustion of coal was collected from the published literature and other sources. The data were abstracted, assembled, and converted to common units of expression to facilitate comparison and understanding. From these data, emission factors were established that can be applied to coal combustion processes to determine the magnitude of air pollutant emissions. Also discussed are the composition of coal, theory of coal combustion, emission rates, gaps in emission data, and future research needs. (Author)

SOIL AND SEDIMENT ANALYSIS: PREPARATION OF SAMPLES FOR ENVIRONMENTAL RADIATION SURVEILLANCE. PART I. PREPARATION OF SOIL SAMPLES: LABORATORY TECHNIQUES. PART II. ULTRASONIC DISPERSION OF SEDIMENTS FOR SIZE FRACTION RADIOANALYSIS.
Environmental health series.
John H. Abrahams Jr, and Raymond H. Johnson Jr. Jun 66, 33p PHS-999-RH-19

Descriptors: (*Radiological contamination, Soils), (*Soils, Radiological contamination), Sedimentation, Material separation, Ultrasonic radiation, Radioactive waste, Radiation monitors.

For surveillance studies, comparison of activity levels in soil and sediment samples is usually difficult, particularly for 'grab' samples, because of the wide variability in composition of both soil and sediment samples. Thus, radioactivity levels of sediment samples, for example, are likely to be a function of sample composition rather than of the amount of radioactivity present in the ambient water. For this reason, care at each step of the procedure--sample collection, preparation, and analysis--is vital for quantifying the radionuclide content of geologic and hydrologic materials. These studies were conducted to determine whether some active portion of a 'grab' sample, easily separated from the inert part of the sample, would provide a sensitive and reproducible indicator of radiocontamination in the environment. Although the experimental material for these studies consisted of soil and sediments from eastern Massachusetts, it is believed that, when standardized, the method will provide a useful and sensitive indicator for monitoring bottom sediments in general. A COMPUTER PROGRAM FOR THE ANALYSIS OF GAMMA-RAY SPECTRA BY THE METHOD OF LEAST SQUARES,
Charles R. Phillips, Jon A. Stewart, and T. Whit Athey, III. Aug 66, 32p PHS-999-RH-21

Descriptors: (*Computer programs, *Gamma-ray spectra), Analysis, Environmental tests, Computers, Computer storage devices, Radiation monitors, Radiological contamination, Least squares method.

A computer program, written in Fortran II and Fortran IV languages for the IBM 1620 and 7040-1401 computers, respectively, is presented for the analysis of gamma-ray spectra by the method of least squares. The Fortran IV main program and four subroutines are included in appendices. The method is accurate, agreeing favorably with estimated standard deviations, and is sufficiently sensitive to be useful for routine analysis of gamma-ray spectra of a substantial number of low-activity samples. Data provided by a verification experiment show that the least squares method is more accurate than the simultaneous equations method. (Author)

AIR POLLUTION ASPECTS OF TEPEE BURNERS USED FOR DISPOSAL OF MUNICIPAL REFUSE,
Thomas E. Kreichelt. Sep 66, 39p PHS-Pub-999-AP-28

Descriptors: (*Air pollution, Wastes (Sanitary engineering)), (*Wastes (Sanitary engineering), Disposal), Incinerators, Smokes, Garbage, Costs, Efficiency.
Identifiers: Tepee burners.

The report covers an evaluation study of air pollution emissions based upon an extensive literature search and field trips to 15 tepee burners in six states. Smoke as a function of composition and rate of charge was observed, and the effect of burner charging methods, construction, and operational procedures on smoke emissions recorded. None of the tepee incinerators observed in operation meet normal visible emission limitations of air pollution control ordinances of most municipalities. Nuisance problems from fly-ash fallout can be expected within distances of up to 1,290 feet downwind from an operating tepee. (Author)

CONTINUOUS AIR MONITORING PROGRAM IN WASHINGTON, D. C. 1962-1963.

Sep 66, 216p PHS-Pub-999-AP-23

Descriptors: (*Air pollution, Monitors), (*Urban areas, Air pollution), Sampling, Public health, Instrumentation, Carbon monoxide, Sulfur compounds, Dioxides, Oxidizers, Hydrocarbons, Nitrogen oxides.

This report presents the results of the operation of the Public Health Service Continuous Air Monitoring Program (CAMP) in Washington, D. C., during 1962 and 1963. Data on atmospheric levels of sulfur dioxide, oxides of nitrogen, total oxidants, total hydrocarbons, and carbon monoxide are summarized, analyzed, and discussed. The data are tabulated as hourly, daily, and monthly mean concentrations; background information about Washington and a description of the instrumentation used are included.

SCIENTIFIC INFORMATION RETRIEVAL SYSTEM FOR RESEARCH GRANTS.
Environmental health series,
J. J. Sabo, and S. Wieder. Oct 66, 27p PHS-999-RH-22

Descriptors: (*Information retrieval, *Radiological contamination), Scientific research, Search theory, Coding, Data, Measurement.

A method developed for the Division of Radiological Health research grants for use in retrieving scientific information readily by means either of a manual system or an automatic information processing system, or a combination of the two, is described. The principles of the method are applicable or adaptable to other programs in which scientific information retrieval is required. The system described is based on the special experiences of the Division or Radiological Health Research Grants Staff and applies to the problems characteristic of its operations. Specific examples of coding and searching are given, with special attention to needs related to program and discipline areas, as well as to scientific content. (Author)

CONTROL AND DISPOSAL OF COTTON-GINNING WASTES,
1967, 104p PHS-Pub-999-AP-31
A Symposium sponsored by Department of Health, Education, and Welfare, and Department of Agriculture, held in Dallas, Texas, May 3-4, 1966.

Descriptors: (*Wastes (Industrial), Disposal), (*Cotton, Wastes (Industrial)), Air pollution, Dust, Particles, Defoliants, Pesticides, Textile industry, Symposia.

The symposium on the control and disposal of cotton-ginning wastes, held in Dallas, Texas, in May 1966, was jointly sponsored by the Division of Air Pollution, Public Health Service, U. S. Department of Health, Education, and Welfare, and the Agricultural Engineering Research Division, Agricultural Research Service, U. S. Department of Agriculture. The proceedings contain information on the following subjects: the roles of local, state, and Federal agencies in controlling air pollution; the roles of the state extension's gin and mechanization specialists; methods employed in harvesting cotton; operations and characteristics of the cotton gin; methods of collecting seed cotton trash; current gin trash disposal practices; methods of collecting lint cotton trash; air pollution study of cotton gins in Texas; defoliants and pesticides; trash collection and disposal system; design and operation of the in-line filter; considerations for determining acceptable ambient and source concentrations for particulates from cotton gins; and recommendations for needed research and development. STANDARDS OF PERFORMANCE FOR FILM BADGE SERVICES,
Donald E. Barber. Sep 66, 59p PHS-999-RH-20
Contract PHS-86-63-198

Descriptors: (*Dosimeters, *Standards), (*Radiation monitors, *Control), Measurement, Errors, Exposure, Tests, Accuracy.

Standards of performance for film badge services are of general concern to film badge services, users of these services, and regulatory agencies. A quality control program self-imposed by film badge services, but involving all of these groups, is described. Approximately 2,000 film badges were irradiated with various types and energies of radiation. Exposures ranged from 0.002 to 497 roentgens. Film badge services helped design the test procedures, submitted badges for exposure, interpreted exposures, and assisted in determining provisional performance control limits. All services were informed of the test procedures to be used in the test. These error factors are tabulated to show the accuracy of the film badge services tested. Frequency distributions of the error factors served as the basis for selection of control limits used to define acceptable performance. Administrative procedures for periodically evaluating film badge service performance and for recognizing acceptable performance are also described. (Author)

OPTICAL PROPERTIES AND VISUAL EFFECTS OF SMOKE-STACK PLUMES,
William D. Conner, and J. Raymond Hodkinson.
1967, 95p PHS-Pub-999-AP-30
Prepared in cooperation with Virginia State Coll., Petersburg. Dept. of Physics.

Descriptors: (*Waste gases, Optical properties), (*Smokes, Optical properties), Air pollution, Test methods, Visual inspection, Standards, Meters, Optical instruments, Illumination, Particle size, Aerosols.

Two experimental smoke stacks were constructed to provide test plumes for studies of optical properties and visual effects over a wide range of illuminating and viewing conditions. Results indicate that visual effects are not intrinsic properties of the plumes but vary with the background of the plume and with illuminating and viewing conditions. Variation was much greater with white plumes than with black. Tests conducted with trained smoke inspectors showed that their evaluations of nonblack smoke plumes were significantly influenced by these variations. The angular scattering and transmission characteristics of the experimental plumes were measured and estimates of particle size derived therefrom. The study shows that the quantity of aerosols in a plume is best evaluated optically by its transmittance. Special methods for measuring the transmittance of smoke plumes objectively are discussed. The methods involve telephotometry, photography, and photometry of targets; the use of smoke guides; and laser measurements. (Author)

SOURCES OF POLYNUCLEAR HYDROCARBONS IN THE ATMOSPHERE,
R. P. Hangebrauck, D. J. von Lehmden, and J. E. Meeker. 1967, 51p PHS-Pub-999-AP-33

Descriptors: (*Air pollution, Sources), (*Polycyclic compounds, Air pollution), (*Hydrocarbons, Air pollution), (*Waste gases, Polycyclic compounds), Wastes (Industrial), Combustion products, Exhaust gases, Emissivity, Measurement, Sampling, Statistical analysis.
Identifiers: Benzopyrenes.

Rates of emissions of polynuclear hydrocarbons were measured at several sources considered likely to produce such emissions. The sources included heat generation by combustion of coal, oil, and gas; refuse burning; industrial processes; and motor vehicles. The annual emissions of benzo (a)pyrene in the United States were estimated for each of the sources surveyed, to provide a rough gauge of the importance of each source. Small, inefficient residential coal-fired furnaces appear to be a prime source of polynuclear hydrocarbons; other sources may be of local importance. Production of polynuclear hydrocarbons was generally associated with conditions of incomplete combustion. (Author)

EMISSIONS FROM COAL-FIRED POWER PLANTS: A COMPREHENSIVE SUMMARY,
Stanley T. Cuffe, and Richard W. Gerstle. 1967, 33p PHS-Pub-999-AP-35

Descriptors: (*Power plants (Establishments), *Waste gases), (*Air pollution, Power plants (Establishments)), Combustion products, Sulfur compounds, Oxides, Nitrogen oxides, Polycyclic compounds, Hydrocarbons, Particles, Formaldehyde, Carboxylic acids, Arsenic, Carbon monoxide, Coal.

A study was conducted on air pollutant emissions from the six main types of coal-burning power plants. The components tested include sulfur oxides, nitrogen oxides, polynuclear hydrocarbons, total gaseous hydrocarbons, solid particulates, formaldehyde, organic acids, arsenic, trace metals, and carbon monoxide. The report relates the effects of variables such as method of operation, type of boiler furnace and auxiliaries, reinjection of fly ash, and type of coal burned to the concentrations of gaseous and particulate pollutants in the products of combustion. CLIMATOLOGY OF STAGNATING ANTICYCLONES EAST OF THE ROCKY MOUNTAINS, 1936-1965,
Julius Korshover. 1967, 21p PHS-Pub-999-AP-34

Descriptors: (*Anticyclones, Air pollution), (*Air pollution, Urban areas), United States, Climatology, Meteorological charts, Meteorological parameters, Barometric pressure, Motion, Contamination, Air mass analysis.

Since stagnating anticyclones are often associated with incidents of heavy air pollution in urban areas, a 30-year climatology is presented to delineate occurrences of stagnating anticyclones in the eastern United States. Occurrences of stagnation are determined on the basis of pressure-gradient values considered with other meteorological factors. Affected areas are depicted on maps by use of a system of grid points. Data showing cases of stagnation (i.e., episodes) and total days of stagnation indicate that stagnation is most likely to occur in autumn months. (Author)

DISTRIBUTION OF COBALT 60, ZINC 65, STRONTIUM 85, AND CESIUM 137 IN A FRESHWATER POND,
William A. Brungs, Jr. Mar 67, 64p PHS-Pub-999-RH-24

Descriptors: (*Lakes, *Radiological contamination), (*Radioactive waste, Distribution), Accidents, Radioactive isotopes, Cobalt, Zinc, Strontium, Cesium, Water, Radioactivity, Ecology, Aquatic animals, Tissues (Biology), Plankton, Decontamination.

Data were obtained on the physical, chemical, and ecological distribution of four radionuclides added to a small pond. The conditions were comparable to those in an accidental release of radionuclides to an impoundment. Cobalt 60, zinc 65, strontium 85, and cesium 137 were added to a 30,000-gallon pond, with a sand substrate, and containing experimental biota. After 4 days, 10 percent of the cobalt 60, 6 percent of the zinc 65, and 5 percent of the cesium 137 remained in solution. Cobalt 60 and zinc 65 were associated principally with suspended solids, and cesium 137 with bottom sediments. In general, soft parts of biota rapidly accumulated more radionuclides than hard parts, but gradually lost radioactivity as radionuclide concentrations in the water decreased. Clam and snail shells and fish bone usually accumulated zinc 65 and strontium 85 until almost the end of the experiment. The maximum observed accumulation of strontium 85 occurred in the crayfish exoskeleton. Maximum activities of the other test radionuclides were observed in the tadpoles.

NATURAL ENVIRONMENTAL RADIOACTIVITY FROM RADON 222,
John E. Pearson. May 67, 43p PHS-PUB-999-RH-26

Descriptors: (*Radioactive isotopes, Environment), (*Radon, Environment), (*Natural radioactivity, Radon), Soils, Radium, Radioactive decay, Uranium, Plants (Botany), Atmosphere, Sampling, Statistical analysis.

Radium 226 and radon 222 were measured using a deemanation method in which the gaseous daughter, radon 222, is collected and analyzed by an alpha-scintillation method. 'Emanating radium 226' from particles of soil in clay type soils varied from 0.342x10 to the - 12th power grams per gram of dry soil to 0.690x10 to the - 12th power grams per gram. Sandy soils varied between 0.147x10 to the - 12th power to 0.244x10 to the - 12th power. Highest activity measured was 14.3x10 to the - 12th power grams of 'emanating radium 226' per gram of dry soil containing uranium ore. Emanation from ground in Champaign County, Ill., for 216 measurements, was (140 plus or minus 73) x10 to the - 18th power curies of radon 222/sq cm/sec. Other soils released similar values of radon 222 except at locations where uranium 238 is available in commercially significant amounts. Release of radon 222 from the leaves of corn (Zea mays L.) about midday and near the growth peak was approximately 2.6 times that of the soil under the corn at Argonne National Laboratory in one series of six tests. Radon 222 concentrations in the atmosphere were measured in eight series of 24-hour tests, to elevations of 16 m. Values of concentration at various times of the day are presented for the normal environmental levels. (Author)

REDUCTION OF RADIATION EXPOSURE IN NUCLEAR MEDICINE.
Environmental health series,
Kenneth D. Williams, James E. Cooper, Raymond T. Moore, and Albert W. Hilberg. Aug 67, 170p* PHS-Pub-999-RH-301
Prepared in cooperation with Michigan State Univ., East Lansing. Inst. of Biology and Medicine, Contract PH-86-68-16. Proceedings of a Symposium held at the Kellogg Center for Continuous Education, Michigan State Univ., East Lansing, 7-9 Aug 67.

Descriptors: (*Nuclear radiation, Exposure), (*Radiation hazards, Radiography), Radiological contamination, Radiobiology, Radiological dosage, Radiotherapy, Radioactive isotopes, X rays, Instrumentation, Pharmacology, Quality control, Medical personnel.

Representatives from the nuclear medical community, industry, and governmental agencies attended a 3-day symposium, August 7-9, 1967, cosponsored by the National Center for Radiological Health and Michigan State University. Formal presentations, discussion sessions, and work-group reports are included in the proceedings. Representatives of the Atomic Energy Commission and the National Center for Radiological Health defined the roles of these agencies in nuclear medicine. Professionals in the field of nuclear medicine presented the progress to date in the problem areas of internal radiation dosimetry, short half-lived radionuclides, instrumentation, radiopharmaceutical quality control, and manpower development. The work-group reports contain the conclusions resulting from a full day of work-group activity. The participants evaluated the need for reducing radiation exposure from nuclear medical procedures, formulated means that might be employed to use most efficiently the administered amount of radiopharmaceutical, and concluded possible solutions to problem areas in nuclear medicine. FULL-SCALE SYSTEM FOR REMOVAL OF RADIOSTRONTIUM FROM FLUID MILK.
Environmental health series,
Sam R. Hoover, G. K. Murthy, L. F. Edmondson, R. B. Read, Jr., and H. E. Walter. Oct 67, 112p* PHS-Pub-999-RH-28
Proceedings of Seminar, 24-25 February 1965.

Descriptors: (*Milk, Decontamination), Strontium, Radioactive isotopes, Radioactivity, Ion exchange, Storage tanks, Pasteurization, pH, Nutrition, Microbiology, Automation, Quality control, Electrodialysis, Public health, Pilot plants, Removal, Efficiency.

A seminar was held simultaneously with a demonstration of a full-scale system for removing radiostrontium from fluid milk at the Producers Creamery Company, Lebanon, Mo. The removal rate of the process was better than 90 percent. The taste of the treated milk compared favorably with regular milk. Nutritional values were altered somewhat, but animal feeding studies showed no deleterious effects on growth or general health as a result of known changes in the processed milk. The system included storage tanks, ion exchange resin columns, a high-temperature short-time pasteurizer, time and step controllers, and pH controls. Papers were presented on laboratory studies of ion exchange methods, nutritional investigation of milk processed in a pilot plant, microbiological aspects of the fixed-bed process, design and operation of full-scale equipment, problems associated with designing equipment, automation of full-scale equipment, problems associated with quality control and removal efficiency, relationship of the ion exchange process to present day commercial fluid milk processing operations, and additional research and development activities considered for treatment processes. RAPID METHODS FOR ESTIMATING FISSION PRODUCT CONCENTRATIONS IN MILK,
B. Kahn, G. K. Murthy, C. Porter, G. R. Hagee, and G. J. Karches. 1963, 31p PHS-999-R-2

Descriptors: (*Milk, *Radiological contamination), Fission products, Iodine, Strontium, Barium, Cesium, Radioactive isotopes, Ion exchange, Gamma-ray spectroscopy.

Rapid methods are described for identifying and measuring iodine-131, strontium-89, and strontium-90 in milk by chemical separation combined with counting. The use of multichannel gamma spectroscopy is outlined for determining the gamma-emitting radionuclides cesium-137, iodine-131, and barium-140 in milk. The method for iodine-131 yield determinations within 2 to 3 hours, and is designed to measure concentrations of 100 micro-micro-curies/l. The radio-strontium procedure permits analyses of several samples simultaneously in about 5 hours; recovery in tracer studies was found to be 80 plus or minus 5%. The gamma spectroscopy determination is estimated to have accuracy of plus or minus 5-10 micro-micro-curies/l between 0 and 100 micro-micro-curies/l, and plus or minus 5-10% at higher concentrations. CONFERENCE ON POVERTY AND TRANSPORTATION, JUNE 7, 1968: EDITED TRANSCRIPT.
1968, 162p*
Contract FH-11-6845
See also PB-180 956.

Descriptors: (*Economics, Symposia), (*Transportation, Symposia), Wages, Employment, Housing, Passenger vehicles, Distribution (Economics), Urban areas.
Identifiers: *Poverty, Mass transportation.

Attention at the conference focussed on the interrelationships between low income, race, housing location and transportation needs, as well as the means of alleviating transport dependence through the provision of new systems, and redesign of current systems such as mass transit, taxis, jitneys as well as novel systems. Jobs and transportation and income redistribution and transportation were well developed themes. Various experimental efforts under the Urban Mass Transportation program were described. The concern with the budgetary limitations of such programs was expressed. No definitive answers were found. Each city has unique problems but the conference yielded some common insights into the problem of providing mobility to the poor in our cities. (BPR abstract)

AN ACCLIMATION ROOM FOR THE DETECTION OF LOW RADIUM 226 BODY BURDENS.
Environmental health series,
Samuel D. Campbell, and Denis E. Body. 1969, 27p PHS-Pub-999-RH-31

Descriptors: (*Health physics instrumentation, Radium), (*Radiation measurement systems, *Radium), Scintillation counters, Radon, Labeled substances, Radiological contamination, Humans, Respiratory system, Tissues (Biology), Respiration, Trailers, Laboratory equipment, Operation, Sampling, Standards, Health physics.
Identifiers: *Breath radon devices, *Alpha scintillation counters.

A mobile breath radon detection apparatus has been used for measuring low radium 226 body burdens. The unique feature of the apparatus is an acclimation room designed to accommodate subjects for periods up to 1 week in a low-radon environment. Radon concentrations in the acclimation room have been reduced to an operating level of 0.0005 pCi per liter, a reduction of approximately 600:1, by an air processing unit employing activated coconut charcoal. This apparatus permits determination of very low radium 226 body burdens in comfortable surroundings for two subjects simultaneously, during the extended periods required for elimination of previously inhaled radon from the body. The construction and operation of the acclimation room and breath sample collection are described. Radium 226 body burdens for the subjects and a radon elimination curve for one subject are included. PILOT STUDY OF ULTRAVIOLET RADIATION IN LOS ANGELES OCT 1965.
Environmental Health series: Air Pollution,
John S. Nader. 1967, 98p PHS-Pub-999-AP-38

Descriptors: (*Air pollution, *Urban areas), (*Ultraviolet radiation, Attenuation), Public health, Photochemistry, Instrumentation, Periodic variations, Tables, Test facilities, Aircraft, Test methods, Meteorological parameters, California.
Identifiers: Pilot studies, Smog, Los Angeles (California).

Several research groups combined efforts to measure simultaneously the available ultraviolet radiation of the urban atmosphere of Los Angeles under representative environmental conditions. The study was planned to permit evaluation of possible methods of measuring the UV radiation important in photochemical reactions and to obtain preliminary data on the UV radiation energy with respect to location, elevation, and time of day. Measurements were made on five days at various levels of air pollution ranging from no smog to moderate-to-heavy smog. The report is a compilation of data obtained by the several participants, with brief accounts of instrumentation and procedures. The instrumental sensors used to detect the UV radiation were filter photocell, filter phototube, photochemical sensors, photosensitive plastic, and photochromic glass. Air quality and meteorological data for the sampling periods are also presented. A discussion and summary relates the data obtained in measurements by the different methods and at the various locations. (Author)

PARTICLE ACCELERATOR SAFETY MANUAL.

Oct 68, 129p* MORP-68-12
Contract PH-86-67-193
Supersedes Rpt. no. 169-1-R1 dated Jun 68, PB-178 325.

Descriptors: (*Particle accelerators, Safety), Radiobiology, Nuclear industrial applications, Nuclear radiation, Radiological contamination, Radiation monitors, Warning systems, Safety devices, Instrumentation, Shielding, Radioactivation analysis, Hazards, Fire safety, Explosions, Instruction manuals.
Identifiers: Safety engineering.

The purpose of this Manual is to alert the reader to the various hazards and recommend safe practices for common types of accelerators found in the fields of medicine, industry and research. Through the use of this Manual, persons relatively unfamiliar with particle accelerators should be able to identify a specific machine and review the safety considerations of the installation. THE USE OF RADIUM IN CONSUMER PRODUCTS,
Earl W. Robinson. Nov 68, 30p MORP-68-5
Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402, $0.40.

Descriptors: (*Commerce, *Radium compounds), Radiation hazards, Meters, Laboratory equipment, Clocks, Dosage, Test methods, Public relations.
Identifiers: Luminous equipment, Government surplus.

The report discusses the extent of the use of radium in products available to the public. It is an attempt to consolidate information pertaining to these products so that their potential health implications can be put into perspective. A greater awareness is needed to protect the public from potential exposure to consumer radium. The extent and hazards of the use of these products should be understood by all public health agencies. BIOLOGICAL ASPECTS OF LASER RADIATION. A REVIEW OF HAZARDS,
Wellington Moore, Jr. Jan 69, 18p*

Descriptors: (*Lasers, Hazards), Skin, Dosage, Eye, Thresholds (Physiology), Radiation tolerance, Safety, Pathology, Enzymes, Coherent radiation.

Concern over the hazards of exposure to laser radiation has resulted in the establishment of guidelines for human exposure by several agencies. Owing to the incompleteness of knowledge concerning biological effects, particularly long-term ones, it is not possible to set firm protection standards at this time. Current guides are based upon the minimum dose required to produce a visible lesion. These threshold values may vary depending upon the criteria by which they are measured. For the eye, threshold damage has been determined by such varying means as ophthalmoscopy, light microscopic histology, histochemical study and electroretinography. In histochemical studies, impairment of enzyme activity was apparent when the energy level of the light beam had been reduced by 10 to 15% below threshold for ophthalmoscopically visible or histologically detectable lesions. This raises the question of how damage in the human might be demonstrated below levels that are clinically apparent. (Author)

THE NEED FOR STANDARDIZATION PROCEDURES IN THE APPLICATION OF IONOZING RADIATION TO MEDICAL AND DENTAL PATIENTS,
Karl Z. Morgan. 1968, 21p
Presented as part of National Center for Radiological Health's Seminar Program, 15 Nov 1968, Rockville, Md.

Descriptors: (*X rays, Health physics), (*Radiobiology, Standards), Standardization, Safety, Radiation Tolerance, Exposure, Design, Radiological dosage, Medicine, Dentistry, Medical personnel, Radiation hazards, Medical equipment.

It is recognized and emphasized that ionizing radiation is one of the most valuable and essential diagnostic tools of medicine. Every effort should be made to enhance the beneficial uses of this source of energy while minimizing its harmful effects. It is estimated that more than 90% of man-made exposure to ionizing radiation arises for medical diagnosis and that a large fraction of this represents unnecessary exposure. This perhaps is what we could expect when we realize that a large fraction of those in the medical profession who authorize, supervise and administer these x-ray examinations do not have the education, training and certification in its use. As a consequence, much of the equipment and many of the techniques employed do not meet minimum standards required for the protection of the patient. By standardization of the procedures employed in the application of diagnostic x-rays for the rather routine applications, a marked reduction can be made in the patient dose while at the same time providing more and greater detailed diagnostic information on the radiogram. Identifiers: *State X ray programs, X ray apparatus, X ray inspection, Surveys.

This publication contains the proceedings of a symposium held in Atlanta, Georgia on May 21-22, 1968. Cosponsors were the Bureau of Radiological Health, U.S. Public Health Service and the Georgia Department of Public Health. The objectives of the Symposium were to examine critically the goals and procedures of State X-ray protection programs and to determine what changes in organization and operation would enhance their effectiveness. Major subjects discussed are initial surveys and resurveys of X-ray installations, data management, surveyor qualifications, compliance, and regulations.

A PERSPECTIVE ON POTENTIAL RADIATION HAZARDS,
James Robert Cassady. Jun 69, 14p Seminar Paper-004

Descriptors: (*X rays, *Radiation hazards), Dose rate, Mathematical prediction, Neoplasms, Gamma rays, Aging (Physiology), Health physics.

The discussion attempts to show where opinions on potential radiation hazards are based on fact, extrapolation, or pure speculation. It is obvious that the low dose effects of radiation postulated are almost entirely based on extrapolation and speculation. This discussion also attempts to show that, assuming the extrapolations performed are valid (which they most certainly are not), the magnitude of any potential hazard of medical x-ray to general public under current radiological practice is almost unobservable. The author emphasizes that this does not mean that safety precautions need not be observed but rather that, if they are utilized and unnecessary x-radiation is eliminated, the public should have no fear of potential consequences of medical x-rays. X-RADIATION CONTROL PROGRAMS IN THE COLOR TELEVISION INDUSTRY. SUMMARY REPORT ON VISITS TO MANUFACTURERS, MAY 1968-DECEMBER 1968,
Donald R. Smith, Henry J. L. Rechen, and D. J. Nelson, Jr. Mar 69, 29p* DEP-69-1

Descriptors: (*Color television, Radiation hazards), (*Radiation hazards, Control), X rays, Radiation measurement systems, Design, Quality control, Color television tubes, Specifications, Standards, Safety, Industrial research, Television receivers.

This report summarizes visits to color television manufacturers by Bureau of Radiological Health personnel to review the efforts being made in the design of television receivers for the reduction of X-ray emissions. The procedures used by the manufacturers for measuring X-radiation from color television receivers and components under plant conditions are discussed. Improved components and attention to radiation emission control in design and engineering indicate the television industry could manufacture essentially radiation free and safe products now. DISPOSAL OF WASTES FROM WATER TREATMENT PLANTS.
Water pollution control research series.
Aug 69, 295p WP-ORD-2 FWPCA-12120-08/69, W70-00162
Grant WP-1535-01-69

Descriptors: (*Water pollution, Wastes (Sanitary engineering)), (*Wastes (Sanitary engineering), Disposal), Iron, Manganese, Reports, Costs, Analysis, Industrial plants.
Identifiers: *Sludge disposal, Water treatment.

The report is an intensive study of the disposal of wastes from water treatment plants. The wastes

include filter washwater; sludge resulting from coagulation, softening, iron and manganese removal processes; diatomaceous earth filtration; and ion exchange brines. The control of pollution from these wastes is a high priority problem for the water utility industry. A series of four status reports describe in detail what is known of the research, engineering, plant operation, and regulatory aspects of the problem. A special report reviews current technology and analyzes costs of disposal methods, based on data collected from fifteen operating plants. A conference was organized to provide expert evaluation of each report and to extend the data available. Final reports were prepared by committees of conference participants to identify future needs for information in each aspect of the waste disposal problem. These reports recommend substantially expanded programs of research and demonstration. They include extensive lists of specific problems which must be investigated to develop effective and economical technology. Committee reports also recommend establishment of a central service to promote the planning of research and development, and to implement effective programs of new or improved technology. The service would collect, coordinate, and disseminate data on all aspects of water treatment plant waste disposal problems. (Author)

ACTIVATED SLUDGE TREATMENT OF CHROME TANNERY WASTES.
Water pollution control research series.

Sep 69, 176p WP-Ord-5 FWPCA-12120-09/69, W70-00163
Grant WPRD-133-01-68

Descriptors: (*Wastes (Industrial), Disposal), (*Water pollution, Wastes (Industrial)), (*Tanning, Wastes (Industrial)), Industries, pH, Water, Design, Pilot plants, Sanitary engineering, Calcium, Sulfides, Oxidation, Toxicity.
Identifiers: *Activated sludge process, *Sludge treatment.

A waste treatment process was developed and tested, in pilot plant scale, for the treatment of the tannery wastes in combination with municipal sewage. The process consisted of the following steps in the order employed; equalizing and mixing of the alkaline and acid wastes; primary sedimentation; carbonation followed by upflow sedimentation; addition of screened municipal sewage activated sludge treatment and secondary sedimentation of the mixed wastes; and chlorination. The sludges resulting from the treatment of the wastes and sewage were dewatered by centrifuge and were found to be suitable for burial. Design factors for the various steps of the process were developed and are presented in the attached report. Studies were made of the fundamental systems and reactions which form the bases for the processes employed in the pilot plant. (Author)

PAST AND PRESENT STATUS OF RADIATION PROTECTION: A COMPARISON,
Carl B. Braestrup. 1969, 15p Seminar Paper-005
Prepared in cooperation with Francis Delafield Hospital, New York. Presented at the X-Ray Exposure Control Labs. Seminar Program, National Center for Radiological Health, Rockville, Md., 2 Jun 67.

Descriptors: (*Radiation hazards, Protection), (*X rays, Radiation hazards), Radiation injuries, Radiological contamination, Radiography, Radiotherapy, Electron tubes, X-ray diffraction analysis, History, State-of-the-art reviews.

Significant progress has been made during the last few decades in reducing the radiation hazards (medical and nonmedical) to personnel patients, and the general public. The NCRP recommendations and their general adoption by regulating agencies have played an important role in these efforts. There is, however, still need for additional improvement in diagnostic x-ray procedures to further minimize the possibility of systemic injuries. Better beam collimation and the elimination of unnecessary and repetitive radiologic examination should be considered further. Efforts should also be made to evaluate and eliminate radiation hazards of new sources of x-rays emitted as an unwanted by-product. (Author)

APPROACHES TO THE CALCULATION OF LIMITATIONS ON NUCLEAR DETONATIONS FOR PEACEFUL PURPOSES,
G. Hoyt Whipple. 1969, 10p Seminar Paper-006
Prepared in cooperation with Michigan Univ., Ann Arbor. School of Public Health. Presented at the Seminar Program, National Center for Radiological Health, Rockville, Md., 8 Mar 68.

Descriptors: (*Nuclear explosions, Radioactive isotopes), (*Nuclear power plants, Radioactive isotopes), (*Radioactive isotopes, Radiological dosage), Tritium, Krypton, Carbon, Nuclear reactions, Fission product activity, Thermonuclear reactions, Radiological contamination, Water supplies, Atmosphere, Respiration, Food, Plants (Botany), Radiation tolerance, Symposia, Health physics.

The long-term equilibrium levels of tritium, krypton-85, and carbon-14 which are acceptable in the environment have been estimated on the following premises: (1) the three isotopes reach the environment and equilibrate throughout it in periods shorter than their half lives, (2) nuclear detonations and nuclear power constitute the dominant sources of these isotopes, (3) the radiation doses from these three isotopes add to one another and to the doses from other radioactive isotopes released to the environment, and (4) the United States, by virtue of its population, is entitled to 6% of the world's capacity to accept radioactive wastes. These premises lead to the conclusion that U.S. nuclear detonations are limited by carbon-14 to 70 megatons per year. The corresponding limit for U.S. nuclear power appears to be set by krypton-85 at 150,000 electrical megawatts, although data for carbon-14 production by nuclear power reactors are not available. Contract SAph-76496
Paper Copy available from Office of Public Information and Education Environmental Control Administration, U.S. Dept. of Health, Education and Welfare, Rockville, Md. 20852.

Descriptors: (*X rays, Diagnosis), (*X-ray photography, *Photographic images), Images, Radiographic film, Density, Exposure, Experimental design, Measurement, X-ray tubes.

This report reviews the medical diagnostic process involved in determining the pathological condition of a patient made on the basis of available roentgenological information. Several years ago, a program of work on the physics of diagnostic roentgenology was established at the Johns Hopkins University. The general purpose of this program was threefold: (1) to carry out a fundamental study of the parameters of an imaging system that affect image quality; (2) to devise methods to measure these parameters; and (3) to make available to the field of radiology the results of these measurements on apparatus currently available in the United States. The manner in which the measurements were analyzed and a summary of the characteristics of radiographic films and screens currently available in the United States are included. Detailed data from the measurements are not included because of their bulk; these data will be published as a separate report in the Environmental Health Series. A set of tables and curves are presented in the appendix of this report to indicate the format in which the data will be published. (Author)

Descriptors: (*Nitrates, *Water pollution), (*Reduction (Chemistry), Nitrates), (*Iron compounds, Oxidation-reduction reactions), Sulfates, pH, Nitration.
Identifiers: *Water treatment, *Denitration, Iron sulfate.

A new and unexpected partial denitrification of dilute nitrate ion solutions (10 to 50 ppm NO3 (-)-N) has been achieved by treatment with 8 moles of

ferrous sulfate per mole of nitrate in unbuffered alkaline reactions. The nitrogen loss, which probably represents evolution of N2 or N2O, has been as high as 50%. Total reduction to lost nitrogen plus nitrite and/or ammonia has approached 100%. The reduction takes place in the presence of partially oxidized black iron hydroxides, and requires catalytic quantities of cupric ion. Denitrification is suppressed by phosphates, as well as by several other factors, some as yet unidentified. Silver ion catalysis or a 16-fold excess of the ferrous salt permits reduction to ammonia in the presence of phosphate, but there is no accompanying denitrification. (Author)

Contract PH-86-64-39
PORTIONS OF THIS DOCUMENT ARE NOT FULLY LEGIBLE.

Descriptors: (*Water pollution, Control), (*Wastes (Industrial), Processing), (*Wastes (Sanitary engineering), Processing), Commerce, Distillation, Adsorption, Electrodialysis, Disposal, Water supplies, Rivers.
Identifiers: *Waste water, *Waste water treatment.

Full conventional waste water treatment will usually be applied before advanced treatment methods are required. To assess the present status of waste water treatment, the type of treatment now in use and the amount of waste water discharged were determined for the major streams in the country. About 4 percent of 100-mile river basins now have full secondary treatment. A study was made to determine the percentage of municipal waste water present in surface supplies of 155 cities of populations of 25,000 or more. The maximum was 18 percent, and median was 3.5 percent. (Author)

SULFIDE TREATMENT OF ACID MINE DRAINAGE.
Water pollution control research series.

Nov 69, 73p* W70-01488, DAST-2
Grant FWPCA-14010-DLC

Descriptors: (*Water pollution, *Iron compounds), (*Chemical precipitation, *Sulfides), Limestone, X-ray diffraction analysis, Cost effectiveness, Coal.
Identifiers: *Water treatment, *Mine waters, Chemical removal (Water treatment), *Coal mines, Iron sulfides, Hydrogen sulfide.

During an earlier program a process for the treatment of coal mine drainage was conceived, involving the combined addition of limestone and hydrogen sulfide to effect precipitation of iron sulfides (LHS process). The black sludge formed during treatment undergoes oxidation at a rate depending on drying conditions with formation of elemental sulfur. X-ray diffraction analyses indicate the iron sulfide sludge component is an amorphous material. The unstable nature of the sulfide sludge, possibility of polysulfide formation during treatment, instability of mine waters of the type amenable to treatment, and inadequacies of available gas metering equipment are among the factors which militate against the controlled regulation of hydrogen sulfide feed necessary for successful operation of the process. These factors, and additional disadvantages revealed by an updated cost evaluation, lead to the conclusion that the LHS process is less attractive than accepted methods of mine drainage treatment. CRAZED RESIN FILTRATION OF COMBINED SEWER OVERFLOWS.
Water pollution control research series.

Oct 68, 127p W70-01487, DAST-4
Contract DI-14-12-39

Descriptors: (*Water pollution, Reduction), (*Rainfall, *Sanitary engineering), (*Sewage, Volume), (*Liquid filters, Feasibility studies), Plastics, Crazing, Water filters, Fibers (Synthetic), Manufacturing methods, Porous materials, Permeability, Fluid dynamic properties, Hydrostatic pressure, Design, Performance (Engineering), Cost effectiveness.
Identifiers: *Sewage filtration, Combined sewers, Overflows, Sewer filters, Volume reduction, Dispersions, Crazed plastics, Pressure filtration, Evaluation.

Increased sewage flows during storm conditions in most combined sewer systems dictate that most or all of the flow be diverted from treatment facilities directly to the receiving body because the flow exceeds the treatment capacity. If a large amount of the solids can be removed before discharge to the receiving water, a major part of the pollutional load would be removed. The feasibility of developing a self-cleaning, self-adjusting filtering device constructed of cylindrical structures of fibers laid down in predetermined patterns by a winding process and bonded in place by resins was investigated. The permeability of the structure is imparted by a mechanical cracking of crazing of the resin. Filtration runs showed a 62 percent reduction of suspended solids in the filtrate. However, sustained runs could not be realized. The self-cleaning aspect was not demonstrated. (Author)

REDUCTION OF GROUND-WATER INFILTRATION INTO SEWERS BY ZONE PUMPING AT MERIDIAN, IDAHO.
Water pollution control research series.

Jun 69, 37p W70-01489, DAST-9
Grant FWPCA-11020

Descriptors: (*Water pollution, Reduction), (*Hydrology, *Sanitary engineering), (*Sewage, Volume), Pumps, Drainage, Water wells, Irrigation systems, Pipes, Rainfall, Periodic variations, Fluid flow, Cost effectiveness, Ohio.
Identifiers: *Pump drainage, Ground water infiltration, Volume reduction, Sanitary sewers, Sewage treatment plants, Hydrogeology, Observation, Evaluation.

The purpose of this study was to determine if the lowering of the high water table by pumping in a given area of the City of Meridian would eliminate infiltration of ground water to the municipal sewers. If the infiltration could be eliminated, the large volume of sewage flow that occurs during the irrigation season would be greatly reduced. The topography, geology, precipitation, as well as local irrigation programs are so irregular in character that no definite criteria could be set up to predict what would occur in other area. It is concluded that each area would have to be studied independently to decide the depth of well, pump capacity and local affecting conditions. It is also concluded that the cost of capital investment, cost of operation of these pumping projects in the entire Meridian area to lower the water table would be too expensive to accomplish the purpose of lowering the water table below the sewers so as to materially decrease the flow of infiltration water to the sewage treatment plant. AIR POLLUTION ASPECTS OF HYDROCHLORIC ACID.
Technical rept.,
Quade R. Stahl. Sep 69, 82p*
Contract PH-22-68-25

Descriptors: (*Hydrochloric acid, *Air pollution), (*Industrial medicine, Hydrochloric acid), Reviews, Toxicity, Humans, Animals, Plants (Botany), Manufacturing methods, Corrosion, Chlorine compounds, Halocarbon plastics.
Identifiers: *Hydrogen chloride, Phytotoxicity.

Contents: Effects on humans (Toxicity, Sensory thresholds, Synergistic effects); Effects on animals, Effects on plants (Phytotoxicity, Incidents of plant damage), Effects on materials; Environmental air standards; Natural occurrence; Production sources (By-product process, Salt-acid process, Chlorine-hydrogen synthesis); Product sources; Other sources (Coal, Fuel oil, Automobile exhaust, Burning of chloride-containing plastics; Burning of paper products; DDT production; Lemon pulp extraction); Environmental air concentrations.

AIR POLLUTION ASPECTS OF AEROALLERGENS (POLLENS).
Technical rept.,
Harold Finkelstein. Sep 69, 118p*
Contract PH-22-68-25

Descriptors: (*Pollen, *Air pollution), Effectiveness, Humans, Allergy, Plants (Botany), Materials, Sources, Economics, Control, Analysis.

Aeroallergens (pollens) are airborne materials which elicit a hypersensitivity response in susceptible individuals. The two major responses exhibited are allergic rhinitis and bronchial asthma. The pollens of wind-pollinated plants are the most important of the aeroallergens, and ragweed pollen is commonly found in this group. Ragweed pollen is the cause of more than 90 percent of pollinosis in this country. Other aeroallergens include molds, house dust, danders, and a miscellaneous group of insecticides, cosmetics, paints, and vegetable fibers. Most of the aeroallergen investigations have been concerned with ragweed. Pollen counts are taken daily in many local areas throughout the country. These counts are used as guidelines for anticipating and understanding the incidence of pollinosis in a given area rather than as standards. Local programs of ragweed eradication generally have met with little success in controlling pollen concentrations. The pollen can be windborne for many miles, and therefore pollen entering a city from the outside usually is sufficient to cause pollinosis in the susceptible population. The gravity slide method has been accepted as the standard procedure for pollen sampling by the Pollen Survey Committee of the American Academy of Allergy. (Author)

AIR POLLUTION ASPECTS OF BIOLOGICAL AEROSOLS (MICROORGANISMS).
Technical rept.,
Harold Finkelstein. Sep 69, 109p*
Contract PH-22-68-25

Descriptors: (*Microorganisms, *Air pollution), Bacterial aerosols, Diseases, Effectiveness, Humans, Animals, Plants (Botany), Respiratory diseases, Influenza virus, Materials, Mycobacterium tuberculosis, Cholera, Newcastle disease virus, Control, Sampling, Analysis.

Biological aerosols--suspensions of microorganisms in the air--can cause diseases in humans, animals, and plants and degradation of inanimate materials. The present knowledge pertaining to the relationships between dose-effect, viability, survival of microorganisms in aerosols, and other factors is insufficient for establishing standards for either indoor or outdoor environmental air concentrations. The source of most human and animal airborne pathogens is the host organism that recently harbored the pathogens. However, since biological aerosols generally are detrimentally affected by exposure to the atmosphere, they are usually found in spaces close to the host. The abatement and control of biological aerosols have been successful only in environmentally-controlled indoor spaces. There has been no adequate way to estimate either the cost of the effects of biological aerosols, or the cost of abatement and control. (Author)

STOCHASTIC MODELS FOR BIOCHEMICAL OXYGEN DEMAND AND DISSOLVED OXYGEN IN ESTUARIES,
Stephen W. Custer, and Richard G. Krutchkoff. Feb 69, 249p* Bull-22 W70-01774, FWPCA-16090-02/69

Descriptors: (*Water pollution, Mathematical models), (*Estuaries, Oxygen), Potomac River, Stochastic processes, Statistical distributions, Differential equations, Numerical analysis, Computer programs, Diffusion.
Identifiers: Biochemical oxygen demand, Dissolved oxygen, Dissolved gases.

Two distinct stochastic models, the Non-Dispersion Model and the Diffusion Model were developed for determining the biochemical oxygen demand (BOD) and dissolved oxygen (DO) probability distribution in an estuary. The mean BOD and DO concentrations were functions of time and space, hence the probability distributions were also temporally and spatially dependent. A computer program was employed to summarize the results in a concise form so that it could be used in the overall decision process. Information for a given point in space was obtained five miles downstream from the source. The mean BOD and DO levels were obtained for each increment of the tidal cycle. The frequency of the concentration above each critical value was obtained. A comparison of the numerical results revealed that the traumatic peaks observed for the non-dispersion model were obliterated in the diffusion model. In the light of the numerical results it concluded that the non-diffusion model was inadequate for describing the estuary situation. The diffusion model was verified on water quality survey data for the Potomac estuary. (Author)

GENERALIZED INITIAL CONDITIONS FOR THE STOCHASTIC MODEL FOR POLLUTION AND DISSOLVED OXYGEN IN STREAMS.
Richard H. Moushegian, and Richard G. Krutchkoff. Aug 69, 93p* Bull-28 W70-01775, FWPCA-16090-08/69

Descriptors: (*Water pollution, Mathematical models), (*Rivers, Oxygen), Initial value problems, Probability density functions, Statistical distributions, Stochastic processes, Mathematical prediction, Computer programs.
Identifiers: Biochemical oxygen demand, Dissolved oxygen, Dissolved gases.

A stochastic model was developed and used to predict the biochemical oxygen demand (BOD) and dissloved oxygen (DO) concentrations at several points downstream of a waste discharge. The model used provided a joint density function for both pollution and and dissolved oxygen with given initial conditions. The initial conditions were generalized to permit the output for one stream segment to be the initial conditions for the succeeding stream segment. Interest was focused on the measurement of the marginal distribution of BOD and DO along a stream stretch whose parameters may change at known locations. A computer program assisted in the calculations to obtain marginal distributions. The program allowed for changes in parameter values between one stream segment and the next and could predict distributions for any intermediate locations along the river. The application of this study lay in the analysis of an entire stream stretch to determine if it was healthy for the users within certain preset probabilistic standards. (Author)

USE OF MATHEMATICAL MODELS IN WATER QUALITY CONTROL STUDIES,
Alvin S. Goodman, and Richard J. Tucker. Jul 69, 140p* FWPCA-16090-07/69
Grant WP-01090

Descriptors: (*Sewage, Water pollution), (*Rivers, Water pollution), (*Water pollution, *Hydraulic models), Mathematical models, Sanitary engineering, Statistical analysis, Programming (Computers), Quality control, Costs, Purification, Fluid flow, Sampling, Accuracy.
Identifiers: *Stream pollution, *Water quality, Sewage treatment, Stream flow, Computerized simulation, Waste water, Water treatment, Biochemical oxygen demand.

Mathematical models were utilized to study water pollution control programs in a river basin. Sensitivity analyses, with a steady state model, showed substantial variation of cost for sewage treatment, depending upon stream purification parameter selections. When actual parameters are less favorable than design values, quality standards may not be met; these effects are more serious with lower levels of treatment. An unsteady state model was developed to trace a time profile at any specified station in terms of flow and quality while up-stream discharge, water temperature, and solar radiation vary. The techniques assume that, for short reaches and/or times, steady state conditions apply without undue loss of accuracy. A new empirical procedure was developed to route unsteady stream flow. The time varying model was used to investigate the effectiveness of an assumed configuration of treatment plants when the stream's assimilative capacity varies with distance and time. Susceptibility to poorer conditions increases with higher BOD releases. Lower treatment levels also result in a greater range of river conditions than high levels. Sensitivity analyses of stream parameters were also made with the time varying model. (Author)

ECONOMIC EVALUATION OF WATER QUALITY. A MULTICOMPONENT MODEL OF OPTIMAL QUALITY CONTROL IN ESTUARINE WATERS.
Rept. no. 4 (Annual),
Shishir K. Mukherjee. Jan 69, 109p SERL-69-2
FWPCA-16090-DLU-02/69
Grant WP-597-05

Descriptors: (*Estuaries, Hydrology), (*Water pollution, Mathematical models), Quality control, Sanitary engineering, Economics, Diffusion, Pipes, Wastes (Sanitary engineering), Linear programming, Theorems, Transport properties, Water supplies, Programming (Computers), Degradation, Oxygen.
Identifiers: Water quality models.

The overall objectives of the study, were to utilize the techniques of operations research to determine the economic effects of changing the water quality requirements of an estuarine water basin. The specific objectives were: To study the transportation, dispersion, and degradation of waste constituents in an estuarine basin. To develop dispersion models for optimal allocation of water quality in an estuary to achieve various related objectives. To develop discrete versions of the disper ion models as linear programs. To develop an integrated multicomponent model of dispersion and waste treatment which will simultaneously provide an optimal plan of waste treatment. To study various modifications of the model and the economic effects of various alternative quality-improvement projects. (Author)

COLLECTION, UNDERWATER STORAGE AND DISPOSAL OF PLEASURECRAFT WASTE. FEASIBILITY OF CONNECTING SEWAGE HOLDING TANKS ON BOARD RECREATIONAL WATERCRAFT TO A DOCKSIDE COLLECTION SYSTEM AND STORAGE IN AN UNDERWATER TANK.

Sep 69, 85p* FWPCA-DAST-10 W70-02283, FWPCA-15020-DHE-09/69
Contract DI-14-12-493
Prepared in cooperation with Silver, Schwartz, Ltd., Washington, D.C.

Descriptors: (*Wastes (Sanitary engineering), Disposal), (*Boats, Wastes (Sanitary engineering)), Storage tanks, Underwater, Collecting methods, Water pollution, Design, Pumps, Sewage, Costs.

A pilot plant was designed, constructed and operated to show the feasibility of providing a facility for the collection, storage and disposal of waste from recreational watercraft. An on-board holding tank was installed in each of ten boats for total impoundment of all effluent and for the connection to a dockside sewage collection system through a quick-connect coupling. Each boat was provided with a pump, tank and macerator. At dockside, each boat holding tank was pumped directly into a piped collection system. The project demonstrated that on-board storage of watercraft waste and subsequent discharge to an underwater storage tank was effective and economical. This project showed that the discharge of sewage from boats into rivers, lakes, waterways and estuaries could be eliminated. (Author)

AEROBIC TREATMENT OF FRUIT PROCESSING WASTES.
Water pollution control research series,
Larry A. Esvelt. Oct 69, 145p* FWPCA-DAST-8 W70-02284, FWPCA-12060-FAD-10/69
Prepared in cooperation with Gray and Osborne Consulting Engineers.

Descriptors: (*Canning, Wastes (Industrial)), (*Wastes (Sanitary engineering), Disposal), Fruits, Processing, Industrial plants, Water pollution, Bacteria, Costs, Design, Disposal.

The treatment systems were studied over the two operating seasons, and operated as an aerated lagoon, as an activated sludge treatment system and as activated sludge system but including sludge reaeration. Data was collected on biological substrate assimilation, sludge growth, oxygen uptake and sludge settleability. Constants were obtained from this data. Success of the treatment system is reported and the costs of treatment computed. It is recommended that aerated lagoon treatment be used where 70 percent removal of BOD is desired and suspended solids are permissible in the effluent. Activated sludge treatment is recommended for greater than 90 percent BOD removal and where effluent suspended solids must be minimized. (Author)

The Phase I study, which was a national survey of all licensed and registered medical users of radionuclides, required the compilation of a comprehensive registry of physicians using radionuclides for medical purposes, and the development of a survey questionnaire. The survey questionnaire was designed to determine a physician's usage of radionuclides in diagnostic, therapeutic, and research procedures in 1966. The diagnostic procedures included function studies (in vitro and in vivo), and scanning studies. The therapeutic procedures included radiopharmaceutical therapy, brachytherapy, and teletherapy. In the Phase II study, the practice of diagnostic nuclear medicine was described with particular emphasis on those measures that minimize patient radiation exposure. A statistical approach using a sampling of practitioners as the data source was employed. A survey questionnaire was designed to obtain data on radiopharmaceutical handling, patient safeguards, and instrument calibration practices. (Author)

EVALUATION OF RADON 222 NEAR URANIUM TAILINGS PILES.

Mar 69, 73p DER-69-1

Descriptors: (*Uranium, Material removal), (*Radioactive isotopes, Radon), (*Radon, Radiological contamination), Collecting methods, Dose rate, Radioactive waste.
Identifiers: Tailings.

The results of a yearlong study to evaluate the public health aspects of atmospheric radon 222 concentrations in the vicinity of uranium mill tailings piles are presented. Samples were collected from 13 onpile and 44 offpile stations in the four study cities of Grand Junction and Durango, Colo., and Monticello and Salt Lake City, Utah. The tailings pile at Monticello has been covered and stabilized; the other three are uncovered and unstabilized. The side slopes of the pile at Grand Junction are partially stabilized with a grass cover. A technique for taking integrated air samples for radon near uranium tailings piles has been developed, tested, and proven through use in the field. Atmospheric concentrations of radon in areas near uranium tailings piles have been evaluated as an index to radiation exposure of the population. The results indicate no significant radiation exposure to the public from this source. (Author)

A FIELD METHOD FOR THE DETERMINATION OF LEAD IN GLASS USED FOR SHIELDING TELEVISION RECEIVER COMPONENTS,
Harry Levine, and Paul S. Ruggera. Dec 69, 16p* DEP-69-2

Descriptors: (*Color television, *X rays), (*Lead, Chemical analysis), Iodides, Electromagnetic shielding, Glass.
Identifiers: *Lead glass, Hydrofluoric acid.

The transmission of X-rays through the glass envelopes of certain types of television tubes, or through the glass covering X-ray fluoroscopic screens, is influenced by the amount and type of high atomic number elements in the glass. Interest in this aspect of the subject was stimulated by recent findings that color television receivers have been shown to emit X-radiation. These emissions have been found to originate from picture tubes, shunt regulator tubes, and high voltage rectifier tubes. When conducting inspections of equipment where transmission of X-radiation is in question, it is useful for the inspector to know the composition of the glass so that its ability to absorb X-rays may be estimated. Lead is the element most commonly used in glass for its radiation attenuation. A rapid, semi-quantitative method for the detection and estimation of lead in glass, suitable for use in the field, has been developed. It is based on the action of a mixture of hydrofluoric acid and sodium iodide on lead contained in glass and ceramics. Important features of this test are that the reaction can be evaluated in a matter of minutes in the field without causing visible damage to the specimen, and the elimination of the conventional chemical analysis that is generally performed in the laboratory. It will show at once whether lead is present in appreciable amounts or is essentially absent.

EVALUATION OF A POSSIBLE CAUSAL RELATIONSHIP BETWEEN FALLOUT DEPOSITION OF STRONTIUM 90 AND INFANT AND FETAL MORTALITY TRENDS,
Edythalena Tompkins, and Morton L. Brown. Oct 69, 43p DBE-69-2

Descriptors: (*Radioactive fallout, Mortality rates), (*Infants, Mortality rates), (*Embryos, Mortality rates), Strontium, Children, Leukemia, Radiological contamination, Tables, Statistical analysis, Milk, Experimental design, Reviews.

As early as 1963, Dr. Ernest J. Sternglass expressed his belief that radiation due to deposited radionuclides from fallout has increased the burden of diseases, such as leukemia, and altered the trend of infant and fetal mortality in the United States. More recently, through public forums, published articles, and presentations at scientific meetings, Dr. Sternglass has given added emphasis to what he considers a highly significant and disturbing finding in changing patterns of infant and fetal mortality, which he has attributed primarily to levels of 90Sr in the environment. Because of the magnitude of the problems implied in these allegations, the Public Health Service conducted an evaluation of the reports written by Dr. Sternglass. This critique, based primarily on Dr. Sternglass' report given at the 9th Annual Hanford Biology Symposium on May 5-8, 1969, in Richland, Washington, resulted in a failure to agree with the scientific approach used by Dr. Sternglass in evaluating the data he has utilized in his report. Descriptors: (*Flight instruments, Maintenance), (*Radium, Flight instruments), (*Test facilities, Radiological contamination), Health physics, Alpha particles, Decontamination, Radioactive waste, Disposal, Radiological dosage, Technicians.
Identifiers: *Radium luminous dials, Radium dial instruments.

Dial-stripping operations in aircraft instrument repair facilities have caused alpha-particle contamination levels exceeding 100,000 disintegrations per minute/100 cm square. Existing radium control programs in these facilities are inadequate. Instrumentation, training, and assistance for decontamination and waste disposal are needed in most of the facilities surveyed. Two workers in the facility with the highest levels of contamination had body burdens in excess of 40 percent of the maximum permissible body burden of radium, and a third worker had a possible body burden of about 14 percent. Workers in all other facilities included in the study had less than 10 percent of the maximum permissible body burden. A recommended control program for aircraft instrument repair facilities is described. Decontamination of one aircraft instrument repair facility was conducted to evaluate decontamination methods for floors, benches, and equipment. (Author)

Descriptors: (*Radiation hazards, Bibliographies), (*Radiography, Standards), Radiation measurement systems, Medical equipment, Design, X rays, Exposure, Radiation monitors, Gamma rays, Health physics, Medicine, Dentistry.

This report is an annotated bibliography of standards, regulations, and guides pertaining to medical and dental ionizing radiation protection. Included are annotations of general standards, guides and recommendations; standards on the safe operation, handling, and design of radiation equipment and sources; and standards and guides pertaining to radiation measurement. Since the terminology for regulations, standards, and guides is not uniform among the Federal and State governments, military organizations, and nongovernmental organizations, the annotated documents are designated as Class A (established or adopted by a governmental body acting under the authority of an act, law, or statute), Class B (adopted by consensus of a committee (s) or commission (s) of technical competence in standards-setting organizations), or Class C (not adopted by a standards-setting organization, but contains information pertinent to the preparation of suitable standards or regulations). The annotations include identification of the document, type of standard, intended complier, intended benefitter, limits and specifications, and general guidance. (Author)

Identifiers: Water resources, Water rights, Sewage treatment, Surface waters, Ground water, Flood control.

The present status of water resources management in Puerto Rico is reviewed. Topics discussed include the island's hydrology, streamflow, water availability, water use, water rights, predictions of future needs, water problems, and recommendations. The major problems are pollution control, reservoir sedimentation, flood control, irrigation needs, drainage, and salt water intrusion. Puerto Rico is rapidly industrializing and must solve these problems to continue increasing the standard of living. (USGS abstract)

Water pollution control research series.

Descriptors: (*Water pollution, *Paper industry), (*Wastes (Industrial), *Wood pulp), Foams, Surface-active substances, Economics.
Identifiers: *Kraft paper, Biochemical oxygen demand, *Sulfate pulping, Tall oil.

Laboratory studies of foam separation were conducted to determine the feasibility of this process for reducing B.O.D., solids content, and foaming tendency of clarified kraft mill effluent. Since kraft pulping wastes have a natural tendency to foam, it was expected that the foaming process, which has been found to be useful in treating domestic wastes, might have applications in treatment of these effluents. Both continuous flow and batch experiments were conducted, and liquid and foam heights, liquid feed rates, air sparging rates, and temperature were varied over wide ranges. The B.O.D. reduction in the treated liquid was disappointingly small, averaging less than 5 per cent, and the B.O.D. enrichment in the foam phase was in most cases less than 1.5 times that of the feed. Foaming tendency, however, was significantly reduced by the intentional foaming process. The experimental results suggest that the reductions in B.O.D. and foaming tendency were related to the separation of the tall oil components of the waste. Apparently the remaining B.O.D.- producing materials were not surface active and did not attach themselves to the surface-active components. The cost of using a foam process on kraft mill wastes is estimated to be four to five cents per 1000 gallons of feed; this cost is exclusive of further processing of the concentrated foamate. Based on control of foaming tendency alone, the process would be unattractive from a cost standpoint. (Author)

Identifiers: Water resources, Estuaries, San Francisco Bay, Waste water, Water treatment.

The tendency to set quality of the water resource rather than quality of discharges as the objective of environmental control makes it necessary to develop some relationship between concentration of individual pollutants in the resource and in the discharge in terms of characteristics of the receiving estuary. Moreover, the growing percentage of the water resource which is degraded in quality through beneficial use together with the increasing investment necessary to restore water quality, makes it important to minimize the cost of achieving water quality objectives. The study makes use of modern mathematical models, programming techniques, and input-output analysis to optimize quality control systems; and illustrates the use of the models by examples drawn from San Francisco Bay data and quality requirements. CLEANING OIL CONTAMINATED BEACHES WITH CHEMICALS.
Water pollution control research series.

Aug 69, 30p* FWPCA-DAST-27 FWPCA-15080-FHS-08/69, W70-03349
Limited number of copies containing color other than black and white are available until stock is exhausted. Reproductions will be made in black and white only.

Descriptors: (*Beaches, *Petroleum), (*Water pollution, *Oils), Sand, Cleaning compounds.
Identifiers: *Oil spills, *Oil pollution, *Crude oil, *Dispersants, Emulsifying agents.

Oil-dispersing chemicals were treated for cleaning persistent-type crude oil from experimentally contaminated New Jersey coastal beaches and were found to be generally ineffective. Although they completely cleaned the surface of the oiled sand, they removed little of the total oil. Instead they caused the oil to penetrate more deeply into the underlying sand, thereby compounding the pollution problem by expanding the zone of pollution, complicating any subsequent mechanical removal and, possibly, causing the oil to persist longer. Chemical treatment failed to induce 'quicksand' or cause perceptible erosion of beach sand. A decrease in the 'cohesiveness' of the sand was observed, but this also occurred in the presence of oil alone and could not be attributed to the presence of chemical. (Author)

OXYGENATION OF FERROUS IRON: THE RATE-DETERMINING STEP IN THE FORMATION OF ACIDIC MINE DRAINAGE.
Final progress rept. 1 Apr 66-31 Dec 68,
Philip C. Singer, and Werner Strumm. Dec 68, 218p FWPCA-DAST-28 FWPCA-14010-06/69, W70-03434
Contract PH-36-66-107

Descriptors: (*Iron compounds, *Oxidation), (*Water pollution, *Iron), (*Pyrites, Water pollution), Sulfides, Acids, Theses.
Identifiers: *Mine waters, Iron sulfides.

The rate of oxidation of iron (II) by oxygen conforms to a relationship which is first-order in the concentrations of ferrous iron and oxygen, and second-order in the concentration of hydroxide ion, at pH values between 6.0 and 7.5. The reaction proceeds relatively rapid at pH values greater than 6.5; the half-time of the reaction is 4 minutes at pH 7.0, under a partial pressure of oxygen of 0.20 atmospheres at 25 deg C. The dependence of the oxidation rate on hydroxide concentration has been observed, in this study, at pH values as low as 4.5, where the half-time has increased to approximately 300 days. At lower pH values, the dependence of the reaction rate on pH becomes less marked until at pH values below 3.5, the oxidation proceeds at a rate which is independent of pH. Field results suggest that the observed rapidity of the reaction in acidic mine waters is apparently the result of microbial catalysis. The rate-limiting step among the reactions involved in the oxidation of iron pyrite and the production of acidity in mine drainage waters is the oxygenation of ferrous iron. Oxidation of iron pyrite is by a cyclical reaction involving the slow oxygenation of iron (II) to iron (III) followed immediately by the rapid reduction

of iron (III) by pyrite, generating in turn more iron (II) and acidity. (WRSIC-abstract)

Descriptors: (*Wastes (Sanitary engineering), *Incinerators), (*Fluidized bed processes, *Sewage), Mathematical models, Oxidation, Computer programs, Costs.
Identifiers: *Sewage disposal.

The development of a computer program to evalute sewage sludge fluidized bed incineration systems is described. Data for the program was collected from manufacturers, a literature survey and field trips to operating installations. Most of the data was obtained from the field because of the lack of available information from the other sources. More than fifty correlation relationships were attempted before the necessary data could be reasonably represented. Equations were developed for the least square curves which fitted the data best. These equations were used as the basis for the computer program developed to size some of the major components and to estimate capital, operating and maintenance costs for the fluidized bed incineration system. Contract PH-86-62-14

Descriptors: (*Medical equipment, *Radiation hazards), (*X-ray photography, Radiation hazards), Diagnosis, Exposure, X rays, Statistical data, Radiological contamination, Florida.
Identifiers: *Radiology, *X ray apparatus.

A field study concerned with human patient exposure in x-ray diagnosis was conducted in Polk County, Fla. The study included physical surveys of 91.5 percent of diagnostic x-ray equipment in the county in use by all categories of practitioners of the healing arts. The methodology used is described in detail and discussed, along with the keeping of patient data records, measuring of acceptance of recommendations, devising an improved means of communicating with the practitioner, limited measuring of radiation exposure reduction to the population, and transferring of findings to data processing cards. AN EMANATION SYSTEM FOR DETERMINING SMALL QUANTITIES OF RADIUM-226.
Environmental health series,
Richard L. Blanchard. Nov 64, 26p PHS-Pub-999-RH-9

Descriptors: (*Radium, *Microanalysis), (*Radon, *Scintillation counters), Chemical analysis, Radioactive isotopes.
Identifiers: Radium 226.

A detailed account is given of the construction, operation, and characteristics of an emanation system for the determination of radium-226. The method is specific for radium-226, is well suited for large volume samples containing small quantities of this nuclide, and will accommodate any type of sample that can be prepared in an aqueous solution. The limit of detection at the 95-percent confidence level was calculated to be 0.016 picograms of radium-226, and the transfer and collection of radon-222 was determined to be 100 percent with an average deviation of 3 percent. BEHAVIOR OF CERTAIN RADIONUCLIDES RELEASED INTO FRESH-WATER ENVIRONMENTS.
Annual rept. 1959-1960,
Albert G. Friend, Albert H. Story, Croswell R. Henderson, and Kenneth A. Busch. Jun 65, 100p
PHS-PUB-999-RH-13
Contract AT (49-5)-1288

Descriptors: (*Radioactive isotopes, Distribution), (*Rivers, *Radiological contamination), Environment, Aquatic animals, Fishes, Plankton, Sampling, Algae, Hydrology, Geology.

Radionuclides from various sources, including facilities that produce, process, and handle nuclear material, are entering the fresh-water environment. The Service's Division of Radiological Health, in cooperation with the Atomic Energy Commission, has conducted a number of investigations of streams below atomic energy installations. Two such studies, one on the Mohawk River near Knolls Atomic Power Laboratory, and the other on the Clinch and Tennessee Rivers near the Oak Ridge National Laboratory, are presented in this document. In general, the results show that all segments of the aquatic environment related to these rivers contain measurable quantities of man-made radionuclides. The results of some uptake studies, carried out in a DRH laboratory, are included to supplement the river studies and to aid in interpreting the results obtained in the field. (Author)

IODINE 131 IN CHILDREN'S THYROIDS FROM ENVIRONMENTAL EXPOSURE.
Environmental health series,
Henry N. Wellman, Gerald J. Karches, Warren G. Hansen, Gerald R. Laurer, and Merril Eisenbud.
May 67, 31p PHS-Pub-999-RH-14
Prepared in cooperation with New York Univ., N.Y.

Descriptors: (*Radiological contamination, *Thyroid gland), (*Iodine, Thyroid gland), Metabolism, Children, Environment, Exposure, Milk, Diet, Radioactive isotopes.

Balance studies of environmental iodine 131 over a period of 30 days are reported in children ranging from 1 to 6 years of age. Calculations of expected thyroidal accumulations of iodine 131, based on accepted exponential models and thyroid function factors, are compared with thyroidal iodine 131 measurements performed in a low-background facility. The measured values were lower by a factor of 2 than the calculated accumulation of iodine 131, suggesting a lesser uptake and/or more rapid turnover of iodine in children. The difficulties involved in this type of environmental study and recommendations for improved methodology are discussed. (Author)

QUALITY CONTROL OF RADIOACTIVITY-COUNTING SYSTEMS.
Environmental health series,
H. E. Kolde. Aug 65, 25p PHS-Pub-999-RH-15

Descriptors: (*Radiation measurement systems, Quality control), Reliability, Calibration, Standards, Background, Tests.

Techniques for obtaining satisfactory performance from radioactivity-counting systems are described. Acceptable performance is maintained by routine tests of background and standards combined with the application of statistical criteria of acceptability. The use of control charts in conjunction with the test data is recommended to facilitate determination of satisfactory instrument and sample measurements. Corrective adjustments are made when necessary to assure continuity of reproducible results, which is particularly important for long-term studies. Methods of chart application and interpretation of plot patterns are outlined. Requirements for the design of counting laboratories, suitable performance standards, and associated control measures are also discussed. (Author)

MEDICAL USES OF RADIUM AND RADIUM SUBSTITUTES.
Environmental health series.
Jul 65, 64p PHS-Pub-999-RH-16
Conference on Medical Uses of Radium and Radium Substitutes held at the Center for Continuing

Education, Chicago Univ., Ill., 3-4 Sep 64, summary and conclusions.

Descriptors: (*Radioactive isotopes, Radiotherapy), (*Radiotherapy, Radiation hazards), (*Radium, Radiation hazards), Protection, Accidents, Medicine, Standards, Implants, Radiation tolerance, Safety, Symposia.

Representatives from professional medical societies, leading therapy centers, and governmental agencies attended a 2-day conference, September 3-4, 1964, sponsored by the Division of Radiological Health of the Public Health Service, to discuss programs dealing with the management of radium and radium substitutes for medical uses. The discussions were excerpted from the transcript and organized under the five conclusions reached by the conference. These conclusions indicate a need for comprehensive regulatory programs for radium, sealed source design standards for radium, adoption of suitable radium substitutes, research efforts toward developing better and safer sealed sources, and promotion of therapeutic techniques that will reduce radiation exposure to medical personnel. RADIONUCLIDE ANALYSIS OF LARGE NUMBERS OF FOOD AND WATER SAMPLES.
Environmental health series,
Esther Ferri, Paul J. Magno, and Lloyd R. Setter.
Dec 65, 37p PHS-Pub-999-RH-17

Descriptors: (*Radiological contamination, Measurement), (*Food, Radiological contamination), (*Water, Radiological contamination), Diet, Permissible dosage, Spectroscopy, Radiochemistry, Radium, Strontium, Radioactive isotopes.

As part of the responsibilities of the Division of Radiological Health for environmental surveillance, large numbers of samples are analyzed for gross and specific radioactivity. The processing of food and water samples is described. Included are manpower and equipment requirements, and technical procedures for measurements of appropriate radio activities. Procedures described include techniques for a series of radionuclides, as well as certain stable elements in food, and for gross alpha and beta determinations, gamma spectral analyses, and radium 226 and strontium 90 in water. MORTALITY OF NEW ENGLAND DENTISTS, 1921-1960.
Environmental health series,
Robert L. Glass. May 66, 80p PHS-Pub-999-RH-18

Descriptors: (*Dental personnel, *Mortality rates), (*Radiation hazards, Dental personnel), Epidemiology, Exposure, Radiation effects, X rays, Life span, Statistical data, Cancer.

An epidemiological study was conducted to determine the mortality of dentists in comparison with that of the general population and of physicians. A cohort of 11,478 white male dentists practicing in New England from 1921 to 1960 has been identified from the records of the State licensing authorities. Leukemia mortality has approximated that expected from several sets of standard rates, both in the entire cohort and in that group entering dental practice prior to 1921. Mortality from all causes has been less than that expected from death rates of the New England white male population and U.S. physician population, but greater than that of certain medical specialists. Cancer mortality has been significantly less than, and mortality from cardiovascular diseases about equal to, that of the general population. Suicide is the only cause of death with greater than expected mortality throughout the study period. No relationship between mortality and exposure to ionizing radiation was observed. (Author)

RADIOASSAY PROCEDURES FOR ENVIRONMENTAL SAMPLES.
Environmental health series.
Jan 67, 493p* PHS-Pub-999-RH-27

Descriptors: (*Radioactive fallout, *Chemical analysis), (*Milk, Radiological contamination), (*Food, *Radiological contamination), (*Water pollution, *Radioactive isotopes), (*Air pollution, Radioactive isotopes), Gamma-ray spectra, Radiation measurement systems, Scintillation counters, Radon, Geiger counters, Strontium, Barium, Complex compounds, Volumetric analysis, Uranium, Iodine, Instruction manuals.
Identifiers: Spectroscopic analysis.

The report is a manual of methods used in laboratories of the Public Health Service's National Center for Radiological Health of the Bureau of Disease Prevention and Environmental Control for the determination and interpretation of the radionuclide content of samples collected for environmental surveillance. Step by step procedures are given for the analysis of milk, food, air, water, and other environmental samples. A discussion of instrumentation for these procedures is given, and a program of analytical quality control is described. Appendices include a definition of laboratory practice and terminology and instructions for preparing required reagents. Bibliographic references are included for specific procedures as well as for more general discussions. (Author)

GEORGIA RADIUM MANAGEMENT PROJECT.
Environmental health series,
James S. Benson, Richard H. Fetz, Cecil D. Posey, and Earl W. Robinson. Jan 69, 96p
PHS-Pub-999-RH-34

Descriptors: (*Radiation hazards, Medicine), (*Radium, Radiation hazards), Safety, Storage, Protection, Radiation monitors, Dosimeters, Radiation effects, Public health, Radiological contamination, Exposure.

The investigation concerned an assessment of (a) the extent and types of radium usage in the practice of medicine, (b) adequacy of radiation safety procedures and equipment employed in handling, storing, and using radium sources, (c) leakage of radium sources, and (d) contamination resulting from use of radium in medicine. Phase I of the project surveyed the hospitals of Georgia, and Phase II surveyed medical offices and clinics. Radiological health practices related to the use of radium in most of the hospitals were below acceptable standards. General and specific findings for radiological health practices in medical offices and clinics are presented. Hospitals, medical offices, and clinics were generally unaware of radium contamination insurance. A study of radium contamination insurance is included. (Author)

REGULATIONS, STANDARDS, AND GUIDES FOR MICROWAVES, ULTRAVIOLET RADIATION, AND RADIATION FROM LASERS AND TELEVISION RECEIVERS - AN ANNOTATED BIBLIOGRAPHY.
Environmental health series,
Lloyd R. Setter, David R. Snavely, Duane L. Solem, and Rodman F. Van Wye. Apr 69, 84p*
PHS-Pub-999-RH-35

Descriptors: (*Radiation hazards, Bibliographies), (*Lasers, Radiation hazards), (*Television receivers, Radiation hazards), Standards, Safety, Microwaves, Exposure, X rays, Ultraviolet radiation, Masers, Public health, Protection, Abstracts.

This report is an annotated bibliography of guidelines, standards, and regulations pertaining to public health protection against electromagnetic radiation from television receivers, lasers, ultraviolet radiation, and microwaves. Each category of radiation is treated in a separate section. The annotated documents are designated as Class A (established or adopted by a governmental body acting under the authority of an act, law, or statute), Class B (adopted by consensus of a committee (s) or commission (s) of technical competence in standards-setting organizations), or Class C (not adopted by a standards-setting organization, but contains information pertinent to the preparation of suitable standards or regulations). The annotations include identification of the document, type of standard, intended compiler, intended benefitter, limits and specifications, and general guidance. (Author)

RADIONUCLIDE ANALYSIS OF GAMMA-RAY SPECTRA BY STEPWISE MULTIPLE REGRESSION.
Environmental health series,
Robert H. Shumway. 1963, 26p PHS-Pub-999-R-5

Descriptors: (*Radioactive isotopes, Gamma-ray spectroscopy), (*Gamma-ray spectra, *Regression analysis), Gamma emission, Identification, Least squares method, Health physics, Radiological contamination.

A modification of the usual multiple regression method is described for use in analyzing a gross gamma spectrum from an unknown solution containing many radionuclides. It involves a stepwise multiple regression procedure that sequentially tests the effect of each radionuclide until the spectrum is resolved. The principal advantages over the 'spectrum stripping' or conventional multiple regression are that the procedure: (a) requires no a priori assumptions about the radionuclide content of the solution, and (b) utilizes the information in all of the channels simultaneously. TRITIUM CONTAMINATION IN PARTICLE ACCELERATOR OPERATION.
Environmental health series,
Donald O. Nellis, Emmett L. Hudspeth, Ira L. Morgan, Patricia S. Buchanan, and Richard F. Boggs. Nov 67, 55p PHS-Pub-999-RH-29
Contract PH-86-66-168

Descriptors: (*Particle accelerator targets, Tritium), (*Tritium, *Radiological contamination), Cockroft-Walton accelerators, Radiation hazards, Health physics, Deuteron bombardment, Particle accelerator components, Vacuum pumps, Van de Graaff generators, X-ray spectroscopy, Autoradiography, Safety.

Tritium-metallic targets are frequently used in many particle accelerators for the production of high-energy neutrons. The purpose of this study was to investigate the problems and hazards associated with the use of these tritium targets so that appropriate steps can be taken to minimize the potential radiological health hazards. Particular emphasis was placed on the operation of Cockcroft-Walton neutron generators, since these constitute a high percentage of such particle accelerators which utilize the tritium-metallic targets. The study showed that bombardment of tritium targets results in the loss of about 1 tritium atom for each bombarding deuteron, and that most of the tritium is in a gaseous form when it leaves

the target. It was also determined that a relatively small amount of the tritium released from the target actually remains within the accelerator itself. Most of the tritium lost by a bombarded target is trapped in the elements of an ion pump or released through the vacuum system exhaust. (Author)

Jul 68, 50p PHS-Pub-999-R-6
Contract SAph-73763
Revision of report dated May 64.

Descriptors: (*Radiological contamination, *Milk), Strontium, Iodine, Control, Missouri, Bovines, Grasses, Fertilizers, Radioactive isotopes.

Studies conducted over a 3-year period have shown that levels of strontium-90 and iodine-131 in milk can be moderated by optimal fertilization of the land. In controlled experiments, milk from cows grazing on abundant, well-fertilized pastures contained 50 percent or less of these radionuclides than did milk from cows grazing on unfertilized pastures on the same farm. A mechanism of dilution of the fission-product contamination in the larger volume of faster growing fertilized forage was shown to account for the differences in the milk. The findings suggest one possible means of controlling fission-product contamination in milk, if such control measures should be necessary. The results indicate that the high levels of strontium-90 in the St. Louis raw milk samples may have been due more to marginal fertilization of the farms than to uneven deposition of fallout. EVALUATION OF OPERATING PARAMETERS OF ALUMINA COLUMNS FOR THE SELECTIVE REMOVAL OF PHOSPHORUS FROM WASTE-WATERS AND THE ULTIMATE DISPOSAL OF PHOSPHORUS AS CALCIUM PHOSPHATE,
L. L. Ames. Mar 69, 40p* TWRC-AWTRL-8 W70-03612, FWPCA-17010-02/69
Contract FWPCA-14-12-413

Descriptors: (*Wastes (Sanitary engineering), *Phosphates), Adsorption, Alumina, Sewage, Calcium compounds, Separation.
Identifiers: *Sewage treatment, *Absorbers (Equipment), Columns (Process engineering), Beds (Process engineering).

A synthetic secondary sewage effluent containing 10 to 30 mg/liter phosphate, 300 mg/liter bicarbonate, 112 mg/liter Cl and 50 mg/liter sulfate as anions and 130 mg/liter Na, 60 mg/liter Ca, 25 mg/liter each of K and Mg and 20 mg/liter ammonium as cations was used with 7.6 ml alumina columns to study the effects of various compositional changes on phosphorus removal. The phosphorus capacity was about half for the solution containing no Ca or Mg as compared to solutions containing them. Probably adsorption onto the alumina occurs partly as a calcium or magnesium phosphorus complex rather than as a simple phosphorus anion. Increasing the competing sulfate concentration in the influent solution to 4800 mg/liter showed little effect on phosphorus adsorption. Raising the pH of the synthetic sewage effluent to greater than 8.0 led to precipitation of calcium carbonate on the alumina grains which progressively lowered alumina phosphorus capacity. This problem was not encountered when using actual sewage effluent. It was found that alumina columns could be satisfactorily regenerated with NaOH. (WRSIC abstract)

The objective of the industrial pollution control R and D program was to develop and demonstrate the required technology to achieve required degrees of pollution control by lease cost methods for all significant industrial sources of pollution. This report includes summaries of 150 research, development, and demonstration efforts necessary to resolve industrial pollution problems. A total of 1200 program efforts are listed in tabular presentation. These projects include the latest developments in physical, chemical, biological, and combinations of treatment methods. It is expected to develop further the cooperation of industry to participate in meaningful pollution abatement demonstrations and to increasingly demonstrate the feasibility of in-plant measures, by-product recovery, and wastewater reuse as methods to abate pollution and to reduce treatment costs. Research through in-house efforts and by contracts to industries and universities are to complete state of the art studies related to treatment and control technology for selected industry groups. Industrial wastewaters are to be identified, characterized, quantitized, and classified for all industries of pollutional significance. (Author)

NUTRIENT REMOVAL FROM CANNERY WASTES BY SPRAY IRRIGATION OF GRASSLAND.
Water pollution control research series,
James P. Law. Nov 69, 84p W70-04062, FWPCA-16080-11/69

Descriptors: (*Water pollution, Control), (*Wastes (Industrial), Separation), Solids, Vegetables, Chemical reactions, Sprays, Soils, Nitrogen

compounds, Phosphorus compounds, Rainfall, Grasses, Hydrology.
Identifiers: *Waste water treatment, Cannery waste water, *Water conservation, Runoff.

The Campbell Soup Company plant at Paris, Texas, treats wastewater from the processing operations by spraying onto grassland. Vegetable solids and grease residues are separated and recovered. A comprehensive 12-month study was conducted to determine treatment efficiencies of the spray-runoff treatment system. A total of 133 inches of wastewater was applied to four experimental areas during the study period. Hydrological measurements, chemical removal efficiencies, and changes in soil properties were evaluated in relation to years of wastewater application, soil type, and spray schedule. Hydrological measurements accounted for 93 percent of the total liquid applied and showed that evaporative losses accounted for 18 percent of the total liquid applied; runoff accounted for 61 percent. During periods of heavy rainfall, runoff increased to a maximum of 80 percent of the total applied liquid. The results showed that the system achieved mass removals of 92 to 99 percent of the volatile solids and oxygen-demanding substances, 86 to 93 percent of total nitrogen, and 50 to 65 percent of phosphorus. Soil textural class and system age had very little effect on treatment efficiencies. Evaluation of surface and subsoil samples and soil water at the 3-foot depth indicated an increase in salinity with age, but nitrogen and phosphorus remained low. Much of the phosphorus removed from the wastewater was found in the surface soil layer. (Author)

DISSOLVED-AIR FLOTATION TREATMENT OF COMBINED SEWER OVERFLOWS.
Water pollution control research series.

Jan 70, 244p* W70-04063, PHS-Pub-999-WP-20-17
Contract FWPCA-14-12-11

Descriptors: (*Wastes (Sanitary engineering), Processing), (*Floods, Wastes (Sanitary engineering)), Flotation, Sewage, Costs, Air, Pilot plants.
Identifiers: *Overflows, *Sewage treatment.

A dissolved-air flotation system was evaluated for primary treatment of combined sewer overflows. The major pieces of component equipment were a gyratory screen, hydrocyclones, an air dissolving tank, and a flotation cell. The principal aspects investigated were: (1) Performance of the system during rain events and dry periods; (2) Evaluation of individual components; (3) Capital costs and operating costs for utilizing a flotation system for various size combined sewage overflows; (4) The adaptability of the system for automation and use in remote location; and (5) The ability of the system to treat intermittent and highly variable flows from combined sewage systems. Some chemical aids to flocculation were also tested. The system performed comparably to conventional clarifiers. It appears dissolved-air flotation systems would be economical for handling combined sewer overflows up to 8 MGD. Automation of dissolved-air flotation systems appears possible with conventional control equipment. Chemical aids to flocculation appear to have promise that warrants further study. The system was unique in that all liquid flow passed directly through the air dissolving tank with no recycle. Domestic sewage was studied in lieu of combined sewage during periods of no rain. COST AND PERFORMANCE ESTIMATES FOR TERTIARY WASTEWATER TREATING PROCESSES,
Robert Smith, and Walter F. McMichael. Jun 69, 32p* TWRC-AWTRL-9 W70-04298, FWPCA-17090-06/69

Descriptors: (*Wastes (Sanitary engineering), Processing), (*Water pollution, *Sewage), Costs, Limestone, Filters (Fluid), Carbon, Ammonia, Design.
Identifiers: *Activated sludge process, *Sewage treatment, Waste water, *Tertiary water treatment, Activated carbon treatment, Strippers, Dissolved organic matter, *Sewage filtration.

Generalized estimates of both performance and cost are presented for wastewater treatment processes which can be used with activated sludge process to reduce the pollution load on the receiving stream. Processes and groups of processes believed to be leading candidates for use downstream of secondary treatment are listed. Data from various sources on the fraction of 5-day BOD associated with suspended solids are tabulated. Microscreening or rapid sand filtration removes about 42% of the 5-day BOD and 21% of the COD and TOC. Other solids-removing processes, such as lime clarification, multimedia filtration, and granular carbon adsorption, remove a greater fraction of the suspended solids. Some of the dissolved organic contaminants might be removed, but this appears to be negligible. A large fraction of the dissolved organic species is removed by granular carbon adsorption. Estimates of the concentrations of BOD, COD, TOC, nitrogen, and phosphorus downstream of each group of processes are tabulated. Estimated capital and operating and maintenance costs for each process are shown. (WRSIC abstract)

LABORATORY INVESTIGATION OF THE REGENERATION OF SPENT GRANULAR ACTIVATED CARBON,
A. J. Juhola, and F. Tepper. Feb 69, 100p* W70-04297, FWPCA-17020-02/69
Contract FWPCA 14-12-107
Also available as TWRC-AWTRL-7

Descriptors: (*Wastes (Sanitary engineering), *Carbon), Furnaces, Heating.
Identifiers: *Tertiary water treatment, *Activated carbon treatment, *Sewage treatment, Regeneration (Engineering).

The regeneration of spent granular activated carbon, used in tertiary treatment of municipal waste water, is a three-step process, (1) drying, (2) baking and (3) activating. Laboratory studies with an indirect heated rotary tube furnace demonstrated that the rates at which the drying and baking steps are performed do not have a significant effect on the properties of the baked carbon. The controlling step for the regeneration product is the activation, and the important parameters are the carbon temperature, length of activating time, and steam or carbon dioxide concentration in the activating gas mixture. In multiple hearth furnace regenerations, where the reported carbon losses are 5% to 7% per regeneration, the characteristics of the activating step are: (1) high activating gas input rate, (2) relative short activating time, and (3) relatively low carbon temperature. Thermodynamic calculations made on the hearth furnace regeneration indicate that, by performing only the activation of a previously baked carbon, the hearth furnace gas input rate can be reduced drastically and to the point where it approaches the optimum rate of the rotary tube. Prepared in cooperation with Robert A. Taft Water Research Center, Cincinnati, Ohio, Advanced Waste Treatment Research Lab., Rept. no. TWRC-AWTRL-12. See also Phases 1 and 2, PB-190 168.

Descriptors: (*Sewage, *Carbon), Costs, Operation, Design.
Identifiers: *Activated carbon treatment, *Tertiary water treatment.

The engineering design and cost estimate of a 10 million-gallon-per-day plant for tertiary treatment of waste water with granular activated carbon contains the process description, design bases, plant operation, control rationale, equipment list, equipment specifications and cost estimate. This design incorporates reliability, economy and current state-of-the-art technology. Although not fully proven in practice, it is based upon the application of mature engineering judgement to available data and offers economies over any other plant which has been successfully demonstrated. APPRAISAL OF GRANULAR CARBON CONTACTING. PHASE I. EVALUATION OF THE LITERATURE ON THE USE OF GRANULAR CARBON FOR TERTIARY WASTE WATER TREATMENT. PHASE II. ECONOMIC EFFECT OF DESIGN VARIABLES,
A. E. Cover, and L. J. Pieroni. May 69, 115p* W70-04548, FWPCA-17020-05/69-1/2
Contract DI-14-12-105

Prepared in cooperation with Robert A. Taft Water Research Center, Cincinnati, Ohio, Advanced Waste Treatment Research Lab., Rept. no. TWRC-AWTRL-11. See also Phase 3, PB-190 167.

Descriptors: (*Sewage, *Carbon), Reviews, Economics, Adsorption, Reclamation, Particle size.
Identifiers: *Tertiary water treatment, *Activated carbon treatment, *Chemical oxygen demand, *Sewage treatment.

A literature review of tertiary waste water treatment gives special attention to activated carbon adsorption of chemical oxygen demand (COD), allowable capacity (loading) of carbon with organic waste matter, carbon particle size, and number of regeneration cycles on adsorption capacity and rate. The economic effects of shop fabrication and field erection of vessels, surge designs, plant size, idle carbon inventory, velocity, contact time, particle size, regeneration loss, carbon capacity, material costs, number of contacting stages, and in-place regeneration are discussed. Most of the data were collected from carbon treatment plants at Pomona (California), Lake Tahoe (California), Nitro (West Virginia), Washington (New Jersey), and Lebanon (Ohio). Recommendations are made for further evaluation and experimental work. (WRSIC abstract)

PHOTOLYSIS MECHANISMS FOR POLLUTION ABATEMENT,
Layton C. Kinney, and Victor R. Ivanuski. Oct 69, 53p* W70-04546, FWPCA-17050-10/69
Contract DI-14-12-475
Prepared in cooperation with Robert A Taft Water Research Center, Cincinnati, Ohio, Advanced Waste Treatment Research Lab., Rept. no. TWRC-AWTRL-13.

Descriptors: (*Sewage, *Photolysis), (*Water pollution, Photolysis), (*Wastes (Industrial), Photolysis), Catalysts, Oxidation, Titanium compounds, Zinc compounds, Dioxides, Phenols, Benzoic acids.
Identifiers: *Sewage treatment, Zinc oxides, *Dissolved organic matter, *Waste water treatment.

Photocatalytic oxidation of dissolved organic matter by irradiation of slurries of zinc titanate, zinc oxide, titanium dioxide, and beach sand was studied using sunlamps. The reaction appears to follow first order kinetics in most cases. Zinc oxide appears to be a superior catalyst for this purpose. Photocatalysts are widely distributed in nature, and photolytic oxidation is a mechanism whereby dissolved organic matter is oxidized in the natural environments of streams and lakes. Photolytic oxidation reduced the dissolved organic matter in a sample of domestic sewage by 50% and 75% during 24 hours and 70 hours, respectively. The limiting factor appears to be the activity of the photocatalyst. The most promising area of photolysis application will be in problems of industrial disposal where the concentrations of organic matter are high. (WRSIC abstract)

MATHEMATICAL MODEL OF TERTIARY TREATMENT BY LIME ADDITION,
L. Seidel, and K. Patel. Sep 69, 80p* W70-04547, FWPCA-17010-09/69
Contract DI-14-12-416
Prepared in cooperation with Robert A. Taft Water Research Center, Cincinnati, Ohio, Advanced Waste Treatment Research Lab., Rept. no. TWRC-AWTRL-14.

Descriptors: (*Water pollution, *Phosphorus compounds), (*Calcium oxides, *Sewage), (*Wastes (Industrial), Calcium oxides), (*Phosphates, Water pollution), Costs, pH, Chemical precipitation, Mathematical models, Computer programs.
Identifiers: *Secondary water treatment, *Sewage treatment, *Waste water treatment.

The status of phosphorus removal from secondary effluents by lime addition is presented. Based on the empirical information available, a mathematical model of the process was developed. The factor which best correlated with phosphorus removal was the pH of the tertiary effluent. Cost information for the model was generated based on a solids-contact type precipitator such as the Infilco Densator. A computer program, in FORTRAN IV, derived from the model, was developed for use as a subroutine in the FWPCA Executive Calling Program. Given the input stream flow rate and analyses, and the final pH, the program computes the necessary does of lime and coagulant, their costs, the size and cost of the equipment, the degree of phosphorus removal, and the output stream analyses. OIL SAMPLING TECHNIQUES.
Water pollution control research series.

Dec 69, 62p FWPCA-DAST-12 W70-04654, FWPCA-15080-FHT-12/69

Descriptors: (*Samplers, *Water pollution), (*Petroleum, Water pollution), (*Adsorption, *Oils), Foams, Films, Hydrocarbons.
Identifiers: *Oil pollution, *Oil slicks, *Crude oil.

Sampling of oil in the environment, depending upon the thickness of the slick, can present certain operational problems, most paramount of which is the collection of an adequate volume of sample required for identification by chemical analyses. Several basic 'dip-stick' techniques, which are primarily applicable for sampling slicks with a thickness of greater than 2 mm, as well as suggested methods for sampling thin oil slicks are discussed and illustrated. Included in this report are preliminary results on oil entrapment by solid absorbents. Also reported are results of investigations performed by foreign and U.S. scientists, using various types of sampling equipment and materials. (Author)

OIL TAGGING SYSTEM STUDY, SUMMARY.
Water pollution control research series.

Oct 69, 37p* W70-04655, FWPCA-15080-DJQ-10/69
Contract DI-14-12-500
Also includes Rept. no. FWPCA-DAST-11.

Descriptors: (*Water pollution, Oils), (*Oils, Identification), Tracer studies, Chromatographic analysis, Halogenated hydrocarbons, Tankers, Cargo ships, Pipes, Costs.
Identifiers: *Oil tagging, *Oil pollution, Oil wastes.

Several methods of identifying the source of oil pollution are critically examined. These methods are grouped into two categories: passive tagging and active tagging. Passive tagging assumes that oils are so chemically diverse that their contents constitute a stable chemical fingerprint that can be unequivocally disclosed in the laboratory. Active tagging requires that an inexpensive, coded material be added to oil; this material must be chemically and physically stable in both oil and oil slicks; it must also be readily identifiable by available analytical techniques; and it must have no adverse effect on the oil's subsequent use. Three methods of passive tagging (trace metals, sulfur-isotope ratios, and paper chromatography) and three methods of active tagging (halogenated polycyclic aromatics, organometallics, and coded microspheroids) have been examined. COMPLEMENTARY-COMPETITIVE ASPECTS OF WATER STORAGE.
Water pollution control research series,
Kenneth D. Kerri. Dec 69, 194p W70-04653, FWPCA-16090-DEA-12/69
Also available as FWPCA-DAST-1.

Descriptors: (*Water supplies, Storage), (*Dams, Operation), (*Water pollution, Control), Mathematical models, Simulation, Programming (Computers), Economics, Recreation, Fluid flow, Temperature, Hydrology, Volume, Rivers, Management planning, Drainage, Floods, Damage, Evaporation.
Identifiers: *Water storage, Water resources.

Allocation of scarce water for flow augmentation to enhance water quality and other beneficial uses conflicts with other water demands. An analytical model is proposed that is capable of allocating water to competing demands on the basis of economic efficiency. The value of water is determined from the slopes of the benefit functions for water uses and an algorithm, based on the theory of marginal analysis, allocates water after considering the complementary and competitive uses of available water. Operations strategies may be selected and revised throughout the demand period regarding the amount of water to remain in storage, or stored and then released for downstream uses or downstream diversions. Results predict the frequency and magnitude of shortages for each beneficial use of water. Simulation of the hydrologic and economic systems of the proposed Holley Reservoir in the Willamette Valley in Oregon was used to test the effectiveness of the proposed analytical model and the results appear very good. A daily streamflow model and a relationship between reservoir operation and recreational attendance were developed to produce an accurate simulation of the basin. (WRSIC abstract)

ATMOSPHERIC EMISSIONS FROM SULFURIC ACID MANUFACTURING PROCESSES.
Environmental health series: Air pollution,
Stanley T. Cuffe, and Carlton M. Dean. 1965, 136p PHS-Pub-999-AP-13
Cooperative Study Project. Prepared in cooperation with Manufacturing Chemists' Association, Inc., Washington, D.C. Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $0.60 as FS 2.300:AP-13.

Descriptors: (*Air pollution, *Wastes (Industrial)), (*Sulfuric acid, Manufacturing methods), (*Waste gases, Sulfuric acid), (*Nitrogen oxides, Waste gases), Sulfur compounds, Dioxides, Costs, Economics, Chemical analysis, Sampling, Samplers, Adsorption.
Identifiers: *Sulfur dioxide, *Air pollution control equipment, *Nitrogen dioxide, Concentrators.

The report has been prepared to provide reliable information on atmospheric emissions from sulfuric acid manufacturing plants and on method and equipment normally employed to limit these emissions to satisfactory levels. Background information is included to define the importance of the sulfuric acid industry in the United States. Basic characteristics of the industry are discussed, including growth rate in recent years, types of raw materials used, end uses for the product, and the number of producing establishments, i.e. manufacturing sites, in existence during the past and at the present time. Process descriptions are given for the two processes in commercial use: the contact process and the chamber process. Process information includes discussions of the normal process variables that affect the types and quantities of emissions, the normal range of emissions, startup and shutdown losses, and methods of emission

control and recovery. Supplemental material provides detailed descriptions of sampling and analytical methods. Emissions to the atmosphere from a sulfuric acid plant depend upon a number of factors, such as design of the plant, skill of operation, efficiency of the catalyst, completeness of recovery operations, and the use of special devices to reduce emissions.

EFFECTS OF THE RATIO OF HYDROCARBON TO OXIDES OF NITROGEN IN IRRADIATED AUTO EXHAUST.
Environmental health series: Air pollution,
Merrill W. Korth. Oct 66, 65p PHS-Pub-999-AP-20

Descriptors: (*Air pollution, *Exhaust gases), (*Passenger vehicles, Exhaust gases), (*Photochemistry, Air pollution), (*Nitrogen oxides, Exhaust gases), (*Hydrocarbons, Exhaust gases), (*Plants (Botany), Air pollution), Eye, Irritating agents, Aldehydes.
Identifiers: *Automobile exhausts, Eye injuries, *Smog, Photochemical reactions, *Nitrogen dioxide, *Nitrogen oxide (NO).

As a part of a series of investigations of the problem of vehicle exhaust as an air pollutant, photochemical reactions are being studied in detail by the use of large dynamic irradiation chambers. In these studies auto exhaust, generated by test vehicles on a dynamometer, is diluted with air and irradiated to simulate the effects of sunlight under mixing conditions similar to those in the atmosphere. The irradiated mixture is used to study chemical reactions and to evaluate plant damage and human eye irritation. In this second series of irradiation tests, the ratio of total hydrocarbon (HC) to oxides of nitrogen (NOx) was varied between 1-1/2 and 24. Hydrocarbon concentrations were varied from 3 ppm to 12 ppm total carbon; oxides of nitrogen concentrations were varied from 1/4 ppm to 2 ppm. Greatest plant damage occurred when both the HC/NOx ratios and hydrocarbon concentrations were high. The levels of eye irritation were highest at the higher chamber hydrocarbon concentrations. For a given hydrocarbon level, chemical reaction rates were highest at the high HC/NOx ratios. (Author)

RAPID SURVEY TECHNIQUE FOR ESTIMATING COMMUNITY AIR POLLUTION EMISSIONS,
Guntis Ozolins, and Raymond Smith. Oct 66, 81p PHS-Pub-999-AP-29

Descriptors: (*Air pollution, Analysis), Data, Emissivity, Sources, Inventory, Sampling, Urban areas, Monitors, Geography, Distribution.

A method is presented for estimating rapidly the major emissions of air pollutants in a community. The method is based on information that is readily available in most urban areas; it does not entail extensive surveys or sampling procedures. Application of this survey method will yield a series of tables, maps, and diagrams that indicate (1) the weights of emissions of selected pollutants, by year and by season; (2) the relative importance of various fuels and types of sources in producing the emissions; (3) the relative amounts of pollutants emitted in various geographic sub-areas of the community. Such information constitutes a useful tool for developing an air conservation program. (Author)

HEALTH ASPECTS OF CASTOR BEAN DUST: REVIEW AND BIBLIOGRAPHY.
Environmental health series: air pollution,
Edwin M. Apen, Jr., W. Clark Cooper, Robert J. M. Horton, and Lester D. Scheel. 1967, 135p PHS-Pub-999-AP-36

Descriptors: (*Air pollution, *Reviews), (*Plants (Botany), Toxicity), Dust, Wind, Transport properties, Public health, Allergy, Powders, Sensitivity, Control, Etiology, Bibliographies.
Identifiers: Plant residues, *Castor bean dust, Ricinus communis.

Castor pomace is the residue that remains after castor oil has been removed from the beans of the castor plant Ricinus communis. It is initially in flat cakes, which are broken up into a fine dry powder. This pomace contains one of the most potent allergens nown. It is, therefore, of considerable interest in occupational medicine. Severe allergic reactions frequently occur in exposed workers when appropriate safeguards are not employed. In addition, the fine, light powder form in which the pomace occurs is readily transported from factory and shipping areas into the surrounding community by winds. As a community air pollutant, the pomace can cause widespread and severe allergy in the neighborhoods of mills and factories where it is produced or handled. This publication reviews the occupational and air pollution aspects of castor pomace. An annotated bibliography and selected translations of foreign articles are also included. (Author)

AIR POLLUTION ENGINEERING MANUAL. AIR POLLUTION CONTROL DISTRICT COUNTY OF LOS ANGELES.
Environmental health series: air pollution,
John A. Danielson. 1967, 919p PHS-Pub-999-AP-40
Paper copy available from Superintendent of Documents, GPO, Washington, D.C., 20402, Price $5.75 as FS 2.300:AP-40.

Descriptors: (*Air pollution, Industries), (*Handbooks, Air pollution), Engineering, Incinerators, Gases, Aerosols, Exhaust systems, Filters (Fluid), Adsorption, Metallurgy, Combustion, Petroleum, Law, California.
Identifiers: *Air pollution control devices, Los Angeles (California).

The Air Pollution Engineering Manual deals with the control of air pollution at individual sources. This approach is unique because it emphasizes the practical engineering problems of design and operation associated with the many sources of air pollution. These sources reside in metallurgical, mechanical, incineration, combustion, petroleum, and chemical processes. The air pollution problems presented originate in industrial and commercial sources peculiar to the Los Angeles area. (Author)

CALCULATING FUTURE CARBON MONOXIDE EMISSIONS AND CONCENTRATIONS FROM URBAN TRAFFIC DATA.
Environmental health series: air pollution,
Wayne Ott, John F. Clarke, and Guntis Ozolins.
Jun 67, 43p PHS-Pub-999-AP-41

Descriptors: (*Air pollution, *Carbon monoxide), (*Traffic, Air pollution), Concentration (Chemistry), Urban areas, Environment, Measurement, Statistical analysis, Vehicles, Public health.

The basic goal of this study was to test the feasibility of an urban area approach for calculating carbon monoxide emissions and concentrations from traffic data. That the method provided reasonable results and that the bulk of this report is devoted to a discussion of these results attests to the success of the approach. However, it should not be assumed that the approach is now ready to be applied to a variety of other cities; the authors caution that many of the steps in the approach and the underlying assumptions should best be further examined and refined. This report is intended not primarily as an end in itself but as a starting point for future efforts. (Author)

HANDBOOK OF AIR POLLUTION.
Environmental health series: air pollution,
James P. Sheehy, William C. Achinger, and Regina A. Simon. 1969, 231p* PHS-Pub-999-AP-44
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402, as FS 2.300:AP-44, $2.25.

Descriptors: (*Air pollution, *Handbooks), Data, Statistical data, Tables, Graphics, Physics, Gases, Air, Water vapor, Chemistry, Mathematics, Medicine, Dust, Smokes, Bibliographies.

Individuals working in the air pollution field often need access to data concerning the characteristics and behavior of air, gases and particles, and the chemistry of atmospheric pollutants, and to data of a general nature such as mathematics and common conversion factors. At present, to have access to all this information, the individual needs a wide variety of reference books. The Air Pollution Handbook was designed to consolidate the applicable portions of these numerous references into a single, easily accessible source. The primary consideration for inclusion in the handbook is that the information be unlikely to change. This, then, excludes experimental results and data on air quality, even though these may be quite useful. The one exception to this general rule is the section on medical aspects. The experimental data that is included here is widely accepted in the field of biological experimentation. (Author)

THANKSGIVING 1966 AIR POLLUTION EPISODE IN THE EASTERN UNITED STATES,
Jack C. Fensterstock, and Robert K. Faukhauser.
Jul 68, 47p NAPCA-Pub-AP-45

Descriptors: (*Air pollution, Reviews), Connecticut, Maryland, Massachusetts, New Jersey, New York, Pennsylvania, West Virginia, Tennessee, Alabama, District of Columbia, Air, Quality control, Sources, Humans, Diseases, Public health.
Identifiers: *Air pollution episode 1966.

This report has documented the Thanksgiving 1966 Air Pollution Episode in the Eastern United States in terms of the daily meteorology and ambient air quality. Analysis of the available air quality data indicates that the Air Pollution Potential Forecast Program (APPF) of the Public Health Service and the Weather Bureau did effectively forecast the stagnation. The increase in levels of the pollutants during the same period is indicative of stagnation regardless of the city considered. Advance warning is a necessary step to effective control. To effectively use APPF, municipalities must reduce emissions of air pollutants until meteorological conditions change to provide better ventilation for the affected areas. Monitoring and forecasting at local levels to augment the APPF is also needed. A period of restricted natural ventilation on November 17 covered a small area and was short in duration, precluding it from generating an air pollution potential advisory. However, air quality did deteriorate significantly during this period; pollutant levels recorded in some cities approximated peak concentrations during the subsequent episode. (Author)

AIR QUALITY CRITERIA FOR PARTICULATE MATTER.

Jan 69, 219p NAPCA-Pub-AP-49
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.75 as FS 2.300:AP-49.

Descriptors: (*Air pollution, Effectiveness), (*Particles, Air pollution), Sources, Emissivity, Meteorology, Plants (Botany), Particle size, Economics, Toxicity, Humans, Solar radiation, Respiratory system, Diseases, Quality control, Epidemiology, Materials.
Identifiers: *Air quality criteria.

Air quality criteria are an expression of the scientific knowledge of the relationship between vari-

ous concentrations of pollutants in the air and their adverse effects on man and his environment. They are issued to assist the States in developing air quality standards. Air quality criteria are descriptive; that is, they describe the effects that have been observed to occur when the ambient air level of a pollutant has reached or exceeded specific figures for a specific time period. In developing criteria, many factors have to be considered. The chemical and physical characteristics of the pollutants and the techniques available for measuring these characteristics must be considered, along with exposure time, relative humidity, and other conditions of the environment. The criteria must consider the contribution of all such variables to the effects of air pollution on human health, agriculture, materials, visibility, and climate. Further, the individual characteristics of the receptor must be taken into account. The particulate matter commonly found dispersed in the atmosphere is composed of a large variety of substances. Some of these--flourides, beryllium, lead, and asbestos, for example--are known to be directly toxic, although not necessarily at levels routinely found in the atmosphere today.

PB-190 252
National Ai Pollution Control Administration, Washington, D.C.
AIR QUALITY CRITERIA FOR SULFUR OXIDES.

Jan 69, 186p NAPCA-Pub-AP-50
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.50 as FS 2.300:AP-50.

Descriptors: (*Air pollution, *Sulfur compounds), (*Plants (Botany), Air pollution), (*Diseases, Air pollution), Reviews, Dioxides, Oxides, Chemical analysis, Respiratory diseases, Atmosphere.
Identifiers: *Sulfur dioxide, *Sulfur oxides.

The document focuses on the sulfur oxides commonly found in the atmosphere--sulfur dioxide, sulfur trioxide, their acids, and the salts of their acids. Further, the document considers the effects of the sulfur oxides in conjunction with other pollutant classes, especially particulate matter, where important synergistic effects are observed. The chemical and physical characteristics of the sulfur oxides are reviewed and the various analytical methods for measuring them in the atmosphere are considered. Aso discussed are the effects of the sulfur oxides on visibility, vegetation, and materials. The toxicological effects of sulfur oxides on animals and on man are considered in separate chapters. Finally, there is a discussion of epidemiological studies that assesses the dose-population response and the response of population subgroups (i.e., children, the elderly, respiratory cripples, etc.) to sulfur oxides and to sulfur dioxide in the presence of particulate matter. The literature has been generally reviewed through June 1968. (Author)

CONTROL TECHNIQUES FOR PARTICULATE AIR POLLUTANTS.

Jan 69, 241p NAPCA-Pub-AP-51
Paper copy available from Superintendent of Documents, Washington, D.C. 20402. $1.75 as FS 2.300:AP-51.

Descriptors: (*Air pollution, Control), Particles, Sources, Industries, Internal combustion engines, Incinerators, Passenger vehicles, Bibliographies, Emissivity, Economics.

Particulate material found in ambient air originates from both stationary and mobile sources. Of the 11.5 million tons of particulate pollution produced by industrial, commercial, and domestic sources in 1966, 6 million tons were emitted from industrial sources, including industrial fuel burning; 5 million tons from power generation, incineration, and space heating; and 0.5 million ton from mobile sources. The following techniques are in use for controlling the source or reducing the effects of particulate pollution: Gas cleaning; Source relocation; Fuel substitution; Process changes; Good operating practice; Source shutdown; Dispersion.

ST. LOUIS DISPERSION STUDY. VOLUME II. ANALYSIS,
James L. McElroy, and Francis Pooler, Jr. Dec 68, 56p NAPCA-Pub-AP-53

Descriptors: (*Atmospheric motion, Tracer studies), Diffusion, Particles, Fluorescence, Zinc compounds, Cadmium sulfides, Theodolites, Sampling, Mathematical analysis, Stability, Urban areas, Missouri, Air pollution.
Identifiers: Graphs (Charts), Eddies, St. Louis (Missouri).

The primary analyses performed on data collected during low-level tracer experiments conducted over metropolitan St. Louis, Missouri, are described. Values of dispersion parameters derived from the tracer data are related to readily derived or measured meteorological indices of turbulence. The results are graphically presented in terms of best-fit curves as functions of downwind distance and travel time. Comparisons are made with the results of previous diffusion experiments conducted over relatively uncomplicated terrain in open country. It is concluded that for low-level point sources the urban area affects cross-wind dispersion primarily by enhancing the initial size (i.e., close to the source) of the plume. (Author)

ATMOSPHERIC EMISSIONS FROM HYDROCHLORIC ACID MANUFACTURING PROCESSES.
Cooperative Study Project,
Samuel L. Bean, and Howard Wall, Jr. Sep 69, 66p NAPCA-Pub-AP-54
Prepared in cooperation with Manufacturing Chemists' Association, Inc., Washington, D.C.
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $0.35 as FS 2.300:AP-54.

Descriptors: (*Hydrochloric acid, Manufacturing methods), (*Air pollution, *Wastes (Industrial)), (*Waste gases, Hydrochloric acid), Sampling, Costs, Economics, Chlorides, Halogenated hydrocarbons, Chlorine.
Identifiers: *Hydrogen chloride, Concentrators.

The report is one of a series on atmospheric emissions from chemical manufacturing processes. It provides such information on the manufacture of hydrochloric acid. Basic characteristics of the industry, including growth rate, manufacturing processes, product uses, and the number of producing plants in the United States are discussed. Process descriptions are given for the chlorinated by-product process and the synthesis process, which employs the direct combustion of hydrogen in chlorine. Process information includes the range of emissions of hydrogen chloride from hydrochloric acid manufacturing plants and the methods of limiting or controlling these emissions to the atmosphere. Although other contaminants such as chlorine, chlorinated organics, and other hydrocarbons emitted to the atmosphere from these plants are mentioned and in some cases discussed, they are not the primary concern of this report. Detailed descriptions of the sampling and analytical methods used to measuring such emissions are also included. (Author)

TOBACCO, A SENSITIVE MONITOR FOR PHOTOCHEMICAL AIR POLLUTION,
Walter W. Heck, Frank L. Fox, C. Stafford Brandt, and John A. Dunning. Jun 69, 25p* NAPCA-Pub-AP-55
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402, as FS 2.300:AP-55, $0.25.

Descriptors: (*Air pollution, *Photochemistry), (*Tobacco, Air pollution), (*Plants (Botany), Air pollution), Monitors, Oxidizers, Fertilizers.
Identifiers: *Smog, Leaves (Botany), Plant growth.

The development of a technique by which the sensitive tobacco variety, Bel W3 is used as a monitor for photochemical air pollution is discussed. The technique uses the plant as an indicator of the oxidant complex in both urban and rural areas. Two pilot studies that were conducted over a 3-year period during the development of the monitoring technique are included in the discussion. Attention is given to an explanation of the proper procedures for planting, transplanting, fertilizing, and caring for mature plants. The methods used in determining and recording injury to plant leaves is included; the studies showed almost daily injury to monitoring plants. (Author)

THE CLIMATE OF CITIES: A SURVEY OF RECENT LITERATURE,
James T. Peterson. Oct 69, 53p NAPCA-Pub-AP-59
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402 as FS 2.300:AP-59, $0.55

Descriptors: (*Urban areas, Climatology), (*Climatology, *Reviews), Atmospheric precipitation, Humidity, Atmospheric temperature, Visibility, Solar radiation, Wind, Visibility, Air pollution.
Identifiers: *Urban climate.

The climate of a city differs from that of the rural areas surrounding it, and an increasing amount of scientific research is devoted to comparative studies of urban and rural climates. This report is a survey of the literature on city climatology, with emphasis on that written since the series of articles published by Dr. H. Landsberg, from 1956 to 1962. Those meteorological aspects of urban climate that have been most frequently investigated are discussed herein; they are temperature, humidity, visibility, radiation, wind, and precipitation. AIR QUALITY CRITERIA FOR CARBON MONOXIDE.

Mar 70, 179p* NAPCA-Pub-AP-62
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.50 as FS 2.300:AP-62, See also PB-190 263.

Descriptors: (*Air pollution, *Carbon monoxide), (*Atmosphere, Carbon monoxide), (*Diseases, Carbon monoxide), (*Plants (Botany), Carbon monoxide), (*Exhaust gases, Carbon monoxide), Toxicity, Epidemiology, Chemical reactions, Adsorption, Oceans, Combustion products, Sampling, Hemoglobin, Central nervous system.
Identifiers: *Automobile exhausts.

The document focuses on carbon monoxide (CO) as it is found in the ambient air; therefore, literature on extremely high levels of CO has not been extensively cited. The occurrence, properties, and fate of atmospheric CO and principles of formation and control are reviewed followed by a discussion of estimation of CO emissions and measurement of atmospheric CO. The effects of CO are considered in relation to (1) vegetation, (2) toxicological studies on animals and man, and (3) epidemiological studies. The scientific literature has been generally reviewed through March 1969, with additional sources from reports as recent as January 1970. The literature has been reviewed thoroughly for information related to the development of criteria; and the document not only summarizes the current scientific knowledge of CO air pollution, but also attempts to point up the major deficiencies in that knowledge and the presently recognized needs for further research. AIR QUALITY CRITERIA FOR PHOTOCHEMICAL OXIDANTS.

Mar 70, 202p* NAPCA-Pub-AP-63
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.75 as FS 2.300:AP-63.

Descriptors: (*Air pollution, *Photochemistry), (*Ozone, Air pollution), (*Nitrogen oxides, Air pollution), (*Atmosphere, Air pollution), (*Plants (Botany), Air pollution), (*Diseases, Air pollution), Textiles, Nitrates, Peroxides, Meteorology, Toxicity, Sampling, Chemical analysis, Urban areas, Epidemiology.
Identifiers: *Peroxyacetyl nitrate, *Photochemical reactions, *Nitrogen oxide (NO), *Smog, *Nitrogen dioxide, Eye injuries.

The document focuses on photochemical oxidants as they are found in the ambient air. In general, discussions are oriented towards the physical and chemical nature of these oxidants, atmospheric concentrations and measurement of these oxidants, and possible natural sources of ozone. The presence of photochemical oxidants in the ambient air is then considered in relation to (1) effects on vegetation, (2) effects on materials, (3) toxicological studies of effects on animals and man, and (4) epidemiological studies. The scientific literature has been reviewed through January 1969, with additional sources from publications as recent as November 1969. The results and conclusions of foreign investigations have been evaluated for their possible application to the air pollution problem in the United States. The literature has been reviewed thoroughly for information related to the development of criteria, and the document not only summarizes the current scientific knowledge of photochemical air pollution, but also attempts to point up the major deficiencies in that knowledge and the presently recognized needs for further research. CONTROL TECHNIQUES FOR CARBON MONOXIDE EMISSIONS FROM STATIONARY SOURCES.

Mar 70, 72p* NAPCA-Pub-AP-65
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $0.70 as FS 2.300:AP-65, See also PB-190 261.

Descriptors: (*Air pollution, *Carbon monoxide), (*Iron industry, Air pollution), (*Chemical industry, Air pollution), (*Combustion products, Carbon monoxide), (*Wastes (Industrial), Air pollution), (*Petroleum industry, Air pollution), Steel, Carbon black, Ammonia, Phosgene, Carboxylic acids, Aldehydes, Costs, Carbides, Incinerators, Coal, Petroleum.
Identifiers: *Air pollution control equipment, *Paper industry, Kraft paper.

The document has been prepared to summarize current information on sources of carbon monoxide (CO) emissions, methods of control, and costs and cost-effectiveness of controls. The control techniques described herein represent a broad spectrum of information from many engineering and other technical fields. The devices, methods, and principles have been developed and used over many years, and much experience has been gained in their application. They are recommended as the techniques generally applicable to the broad range of CO emission control problems. Many agricultural, commercial, industrial, and municipal processes and activities that generate CO are described individually in this document. Various techniques that can be applied to control emissions of CO from these sources are reviewed and compared, and equipment costs are included, also. Although exhaust from automobiles constitutes by far the greatest source of CO in the atmosphere, this emission category is not discussed comprehensively in this document. (Author)

National Air Pollution Control Administration, Washington, D.C.
CONTROL TECHNIQUES FOR CARBON MONOXIDE, NITROGEN OXIDE, AND HYDROCARBON EMISSIONS FROM MOBILE SOURCES.

Mar 70, 132p* NAPCA-Pub-AP-66
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.25 as FS 2.300:AP-66.

Descriptors: (*Air pollution, *Passenger vehicles), (*Exhaust gases, Air pollution), (*Hydrocarbons, Air pollution), (*Nitrogen oxides, Air pollution), (*Carbon monoxide, Air pollution), Combustion products, External combustion engines, Electric motors, Costs, Internal combustion engines, Fuel cells.
Identifiers: *Automobile exhausts, *Diesel engine exhausts, *Air pollution control equipment, Stirling cycle engines.

The predominant source of carbon monoxide (CO), nitrogen oxide (NOx), and hydrocarbon (HC) from mobile combustion sources is the exhaust gas from gasoline-fueled engines. The principal mobile sources that generate CO, NOx, and HC emissions are described individually. Various techniques to control such emissions from these sources are reviewed. Technical considerations of the more prominent and feasible design modifications, alternative power sources, fuel modifications, auxiliary devices, and alternative transportation modes are presented. Sections on source evaluation, equipment costs, cost effectiveness analysis, and current research and development also are included. Pertinent references are presented at the end of each section. CONTROL TECHNIQUES FOR HYDROCARBON AND ORGANIC SOLVENT EMISSIONS FROM STATIONARY SOURCES.

Mar 70, 114p* NAPCA-Pub-AP-68
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.00 as FS 2.300:AP-68.

Descriptors: (*Air pollution, *Hydrocarbons), (*Organic solvents, Air pollution), (*Waste gases, Hydrocarbons), Incinerators, Refineries, Chemical industry, Coal, Rubber, Plastics industry, Varnishes, Wastes (Sanitary engineering), Wastes (Industrial), Photochemistry, Iron industry, Costs.
Identifiers: *Air pollution control equipment, Food processing, Dry cleaning.

The effects of hydrocarbon and organic solvent emissions are of two types, direct and indirect. Direct effects are caused by the original, unaltered emissions, and indirect effects are caused by substances formed by photochemical reactions of the original emissions with other substances in the atmosphere. The purpose of the document is to make information available on techniques for the control of organic emissions from stationary sources. Sources of hydrocarbon emissions include petroleum refining, gasoline distribution and marketing, chemical manufacturing, coal coking, fuel burning, waste disposal, and food processing. Sources of organic solvent emissions include manufacture and application of protective coatings, manufacture of rubber and plastic products, degreasing and cleaning of metal parts, dry cleaning operations, printing, and manufacture of chemicals.

AIR QUALITY CRITERIA FOR HYDROCARBONS.
Mar 70, 118p*
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.25 as HE 20.1309:64.

Descriptors: (*Diseases, Air pollution), (*Air pollution, *Hydrocarbons), (*Photochemistry, Air pollution), (*Aldehydes, Air pollution), (*Exhaust gases, Hydrocarbons), (*Plants (Botany), Air pollution), Oxidation, Toxicity, Nitrates, Nitrogen oxides, Aromatic compounds, Aliphatic compounds, Chemical analysis, Benzenes, Ketones, Ethylenes, Irritating agents, Respiratory diseases, Eye, Passenger vehicles, California.
Identifiers: *Automobile exhaust, *Diesel engine exhaust, *Air pollution control equipment, *Smog, *Peroxyacetyl nitrate.

The document focuses on gas-phase hydrocarbons and certain of their oxidation products, particularly aldehydes, that are associated with the manifestations of photochemical air pollution. Particulate hydrocarbons, and more specifically polynuclear hydrocarbons, are not treated in the document. It is important to recognize that the criteria for hydrocarbons rest almost entirely on their role as precursors of other compounds formed in the atmospheric photochemical system and not upon the direct effects of the hydrocarbons themselves. The publication reviews the chemical and physical characteristics of hydrocarbons and their degradation products, especially aldehydes, and considers the basic analytical methods used for measuring the atmoshpheric content of these compounds. A brief review of the sources of hydrocarbons and principles of their control is included. The chemistry of hydrocarbon reactions in the atmosphere is briefly reviewed. The direct effects of hydrocarbons, essentially limited to vegetation damage from ethylene, are discussed. Toxicological data on hydrocarbons and aldehydes are also included. (Author)

RADIATION EXPOSURE OVERVIEW. NUCLEAR POWER REACTORS AND THE POPULATION,
William H. Oates, Jr. Jan 70, 32p BRH/OCS-70-1

Descriptors: (*Nuclear reactors, *Health physics), Power reactors, Standards, Radiological dosage, Radiological contamination, Population, Exposure, Nuclear radiation.

This overview provides information regarding the the radiological health aspects of nuclear power reactors. In addition to broadly documenting the exposures associated with this source of radiation, information presented may be useful for comparing the estimated radiation exposure of the public with that from other sources of environmental exposure. Data are included on the quantities of radioactivity discharged from nuclear power reactors to the environment and comparisons are made with applicable radiological health standards. (Author)

RADIOACTIVE WASTE DISCHARGES TO THE ENVIRONMENT FROM NUCLEAR POWER FACILITIES,
Joe E. Logsdon, and Robert I. Chissler. Mar 70, 84p BRH/DER-70-2

Descriptors: (*Nuclear reactors, *Radiological contamination), Nuclear radiation, Exposure, Health physics, Population, Radiological dosage, Power reactors, Gas-cooled reactors, Isotopes, Boiling water reactors, Pressurized water reactors.

The discharges of radioactivity to the environment from nuclear power stations contribute to the radiation dose received by the general population. In order to provide a better technical basis for surveillance recommendations, radiological data relative to discharges of radioactivity from nuclear power facilities have been compiled. This report summarizes discharges of radioactive material to the environment from nine selected nuclear power facilities and relates the discharges to power produced and plant maintenance operations. The facilities included in this report represent three basic reactor types: pressurized water, boiling water, and high temperature gas. The operating facilities which are not included in this report either represent unique designs not being constructed in the present generation of power plants or they are smaller plants similar in design to those which are included. Descriptors: (*Water supplies, Recovery), (*California, Water supplies), Wastes (Sanitary Engineering), Removal, Irrigation systems, Rivers, Volume, Evapotranspiration, Salts.
Identifiers: San Jacinto Basin, Water conservation, Ground water, Water quality, *Water reclamation, Colorado river.

The water quality factors involved in the recharging of the San Jacinto Basin, California are evaluated so that the overall operation may be conducted in a manner to provide adequate protection of groundwater quality while permitting reclamation of wastes for regional water conservation. Another objective is to study the benefits to the salt balance problem caused by recharging. In the previous situation, some effluents were discharged to the San Jacinto River area and some were used as irrigation water. With recharge there is a significant reduction in evapotranspiration losses, thus improving groundwater quality by diluting the dissolved salts. The safe groundwater yield is limited to approximately 11,205 acre-feet/year. The volumes of water reclaimed and put underground to replenish the overdraft now average approximately 1430 acre-feet/year. Withdrawals now approximate 12,000 acre-feet/year, and importation of Colorado River water approximates 1900 acre-feet/year. Inflow of salt into the basin is now estimated at 5800 ton/year; 3900 ton/year from inflowing groundwater and 1900 ton/year from imported Colorado River water. (WRSIC abstract)

HYDRAULIC AND MIXING CHARACTERISTICS OF SUCTION MANIFOLDS.
Technical rept.,
Ronald E. Nece. Jun 69, 109p TR-26 W70-05468, FWPCA-16080-09/69
Grant FWPCA-WP-00512-5

Descriptors: (*Sewage, Jet mixing flow), (*Hydraulic systems, Sanitary engineering), Disposal, Feasibility studies, Design, Performance (Engineering).
Identifiers: *Manifolds.

Experimental data were obtained on the external hydraulic characteristics and mixing characteristics of suction manifolds to be used in feasibility and design studies of using such devices for predilution in sewer outfalls. Dilution rates and head loss characteristics are given for six single circular side-port manifolds, for multiport manifolds incorporating the same side ports, and for annular ports with and without axial symmetry. Density differentials have relatively little effect on the dilution-head loss characteristics of the configurations tested. Comparison of the two geometries tested shows that the annular-port manifold possesses hydraulic advantages over single circular side-port manifolds. Limitations of operating ranges of the manifolds in sewer outfall applications are delineated. (WRSIC abstract)

Identifiers: *Panoramix roentgenography.

A study was made of body organ exposures resulting from maxillo-facial panographic procedures using the Panoramix an intracavitary radiographic machine. Diagnostic examinations were simulated on a phantom and performed on several patients under laboratory conditions. Thermoluminescent dosimeters were placed at selected internal and external sites of a phantom human bust and at corresponding sites on several dental patients. Various operating parameters and techniques were used and the radiation at various locations was measured. The laboratory and clinical experiments were closely coordinated in order to compare data. The intraoral panoramic method gave exposures to eyes, thyroid and certain ectodermal tissues comparable to exposures from conventional complete mouth intraoral examinations and gave additional valuable diagnostic information. The basis for comparison was the diagnostically acceptable radiograph. (Author)

Descriptors: (*Air pollution, *Economics), (*Urban areas, Air pollution), (*Industries, Air pollution), Control, Sources, Emissivity, Standards, Costs, Particles, Sulfoxides, Hydrocarbons, Carbon monoxide, Incinerators, Generators, Boilers, Paper industry, Petroleum industry, Steel industry, Iron industry, Chemical industry, Coal, Cements, Metals.

Estimates were made of the costs of controlling the emissions of selected pollutants from twenty-two sources within 100 metropolitan areas. The pollutants selected are particulates, sulfur oxides, hydrocarbons, and carbon monoxide. The sources for which control cost estimates were made are solid waste disposal, steam-electric generating plants, industrial boilers, commercial and industrial heating plants, residential heating plants, and the following industrial categories: kraft pulp, iron and steel, gray iron foundry, primary nonferrous metallurgical (copper, lead, zinc, and aluminum), sulfuric acid, phosphate fertilizer, petroleum refining, cement, lime, coal cleaning, petroleum products and storage, grain milling (animal feed) and handling, varnish, rubber (tires and inner tubes), and secondary nonferrous metallurgical (copper, lead, zinc, and aluminum). Essential data defining regional and relevant process and air pollution control engineering characteristics required to support the cost analyses for each source are presented and analyzed in separate appendixes to the report.

WASTE WATER RECLAMATION PROJECT FOR ANTELOPE VALLEY AREA.
Final rept.,
John A. Lambie. Aug 68, 229p W70-05645, FWPCA-17080-08/68
Grants WPD-50-01-64, WPD-50-02-65

Sponsored in part by Grants WPD-50-03-66 and WPD-50-04-67. Limited number of copies containing color other than black and white are available until stock is exhausted. Reproductions will be made in black and white only.

Descriptors: (*Water supplies, California), (*Reclamation, Water supplies), Water pollution, Wastes (Sanitary Engineering), Chemicals, Algae, Fishes, Ecology, Coagulation, Radioactive isotopes, Odors, Personnel, Wastes (Industrial), Tracer studies, Soils, Irrigation systems, Bacteria, Viruses.
Identifiers: *Water reclamation, Antelope Valley (California), Water treatment, Los Angeles County, Limnology, Water quality.

An economically feasible waste water renovation process was developed in Los Angeles County. The tertiary treated product water is pathogenically safe, esthetically pleasing and suitable for fish life. Primary use of the water will be for an aquatic recreation park, but other anticipated uses include soil reclamation, irrigation, and industrial applications. These reuses of waste water will result in the conservation of the presently diminishing fresh water supply in this arid area. All research and testing was done with the knowledge that ultimately the public must accept the concept of reuse of renovated waste water for the project to be a total success. Esthetics of the product water, including clarity, color and odor were important aspects of the treatment process. Test data demonstrate that bacteriological and viral requirements can be met. Fish have successfully survived and propagated in the test ponds. Algal growth and nutrient levels of water in the pilot ponds are considered within acceptable limits. (WRSIC abstract).

LABORATORY TESTING AND EVALUATION OF COLOR TELEVISION RECEIVERS ACQUIRED DURING THE IN-PLANT SURVEY,
Thomas M. Smith, Paul S. Ruggers, and Stephen W. Smith. Apr 70, 107p* BRH/DEP-70-6

Descriptors: (*Color television, *X rays), (*Television receivers, X rays), Hazards, Color television tubes, Voltage regulators, Rectifiers, Dose rate.

A field survey of domestic television manufactures was conducted from June 1969 to September 1969 to determine the x-ray emitting capability of television receivers manufactured after October 18, 1968. During this survey various receivers, identified as being capable of emitting x-radiation, were selected for additional laboratory testing. This report describes the laboratory tests on these receivers, presents the data obtained, and makes recommendations for the reduction or elimination of x-radiation emissions. (Author)

RADIOLOGICAL SURVEILLANCE STUDIES AT A BOILING WATER NUCLEAR POWER REACTOR,
Bernd Kahn, Richard L. Blanchard, Herman L. Krieger, Harry E. Kolde, and David B. Smith. Mar 70, 124p* BRH/DER-70-1

Descriptors: (*Nuclear power plants, *Radiological contamination), (*Boiling water reactors, *Health physics), Radioactive waste, Radioactive isotopes, Fission products, Reactor operation, Water pollution, Air pollution, Atmospheric precipitation, Food, Animals, Water supplies, Radioactivity, Radiation monitors.

The projected increase in the use of nuclear power for electrical generating plants has resulted in both State and Federal public health agencies placing increased program emphasis on the surveillance of nuclear power plants. The Bureau of Radiological Health provides recommended nuclear facility surveillance program information for the guidance of health agencies. In order to provide a better technical basis for our surveillance recommendations, a series of field studies were conducted at operating nuclear facilities to obtain better data on radionuclides in plant effluents and their subsequent distribution in the environment. The technical report summarizes the first such study which was conducted at the Dresden Nuclear Power Station. (Author)

EFFECT OF ANTIBACTERIAL AGENTS ON MINE DRAINAGES. USE OF VIABLE ANTIBACTERIAL AGENTS TO REDUCE POLLUTION BY MINE DRAINAGES.
Water pollution control research series,
Robert E. Shearer, and William A. Everson. Nov 69, 149p FWPCA-DAST-21 FWPCA-14010-EGJ-11/69, W70-05959

Descriptors: (*Water pollution, *Coal), (*Bacteria, Water pollution), Drainage, Wastes (Industrial), Pseudomonadales, Iron, Sulfur, Antibiotics, Streptomyces, Control, Germicides.
Identifiers: *Coal mines, Caulobacter, *Mine waters.

The active agents in natural waters proviously found to inhibit bacterial production of acid in streams were investigated in the laboratory, and inoculations of natural water previously found to be inhibitory were made, about 14,000 gallons each, to a worked-out mine in Pennsylvania. After the first inoculation, tests showed absence of inhibitory power in the water at the time it was collected, and the water used for the second test was similarly found to be only weakly inhibitory. Strains of Caulobacter were found in the natural inhibitory waters, and when adapted to acidic environments and concentrated in culture media, they induced inhibition of acid production. Other adapted strains of Caulobacters also induced inhibition. Some evidence was shown that Caulobacter inhibitors might move downstream. Four species of Streptomyces tolerated acidic conditions, and were effective against the acid-producing bacteria in test tube cultures and on solid media. (WRSIC abstract)

Descriptors: (*Sanitary engineering, Underwater equipment), (*Water, Storms), (*Water pollution, Control systems), Storage, Fluid flow, Bags (Containers), Feasibility studies, District of Columbia.
Identifiers: Combined sewers, Stormwater, Underwater storage, Pilot studies, Washington (District of Columbia).

A pilot plant was designed, constructed and operated to asses the feasibility of providing a facility for the collection, treatment, storage and final disposition of a portion of the storm overflow from a combined sewer system serving a thirty-acre drainage area in Washington, D.C. A Parshall flume was installed in the overflow line for measurement of flow rates and determination of total overflow volume. A portion of the overflow was diverted to the pilot plant through grit chambers and a comminutor. Flow was stored in two 100,000-gallon underwater bags fibricated of nylon reinforced synthetic rubber and fastened to the river bed by a system of patented anchors. During the period of storage, compressed air was delivered to the tanks for agitation of the solids. Following cessation of the storm, contents of the bags were pumped to the interceptor sewer for delivery to the District of Columbia Sewage Treatment Plant at Blue Plains. Flow into and out of each underwater storage tank was metered and recorded. Samples of the combined sewage overflow discharged to the bags and pumped discharge from the bags were collected and subjected to laboratory analyses. (Author)

WORKBOOK OF ATMOSPHERIC DISPERSION ESTIMATES.
Environmental health series: Air Pollution,
D. Bruce Turner. 1970, 88p* PHS-Pub-999-AP-26

Descriptors: (*Air pollution, Aerosols), (*Aerosols, Scattering), (*Handbooks, Air pollution), Wind, Diffusion, Temperature, Aerodynamics, Models (Simulations).

The workbook presents methods of practical application of the binormal continuous plume dispersion model to estimate concentrations of air pollutants. Estimates of dispersion are those of Pasquill as restated by Gifford. Emphasis is on the estimation of concentrations from continuous sources for sampling times up to 1 hour. Some of the topics discussed are determination of effective height of emission, extension of concentration estimates to longer sampling intervals, inversion break-up fumigation concentrations, and concentrations from area, line, and multiple sources. Twenty-six example problems and their solutions are given. Some graphical aids to computation are included. (Author)

STUDY OF POWDERED CARBONS FOR WASTE WATER TREATMENT AND METHODS FOR THEIR APPLICATION.
Sep 69, 40p* W70-06264, FWPCA-17020-DNQ-09/69
Contract FWPCA-14-12-75

Descriptors: (*Sewage, *Carbon), (*Wastes (Sanitary engineering), *Adsorption), Porosity, Surface properties.
Identifiers: *Activated carbon treatment, *Sewage treatment.

Eleven commercial and experimental powdered activated carbons were subjected to an intensive laboratory evaluation of their physical and adsorptive properties to select those best suited to treating municipal waste water and to gain insight into properties important for this application. Correlations were made between capacities for absorbing organic impurities from municipal secondary effluent, as measured by TOC (Total Organic Carbon) adsorptive capacities, and carbon properties such as iodine value, molasses decolorizing index and pore structure. It is suggested that the best carbon for adsorbing organics from municipal wastes have a broad spectrum of pore sizes. Particle size of the powdered carbons was found to strongly affect the rate of adsorption. Aqua Nuchar, Hydrodarco, and pulverized Nuchar WV-L are recommended for further study. (WRSIC abstract)

PRELIMINARY OPERATIONS PLANNING MANUAL FOR THE RESTORATION OF OIL-CONTAMINATED BEACHES.
Water pollution control research series.

Feb 70, 76p* W70-06319, FWPCA-15080-EOS-3/70
Contract DI-14-12-811

Descriptors: (*Beaches, Cleaning), (*Water pollution, Beaches), Handbooks, Earth-handling equipment.
Identifiers: *Oil pollution, *Oil spills.

An Operations Planning Manual was prepared for use by Federal Water Pollution Control Administration personnel involved in oil-spill cleanup operations. The surface conditions and topography of a beach contaminated with oil and the manner in which the oil has been deposited onto the beach will dictate the choice of equipment to be utilized and the operating procedures to be followed. The procedures tested utilize motorized graders, motorized elevating scrapers, front end loaders, and conveyor-screening systems. A motorized grader and motorized elevating scraper working in combination provide the most rapid means of beach restoration; and in addition, their use results in the removal of the smallest amount of uncontaminated beach material. COMMUNITY ACTION GUIDEBOOK FOR SOIL EROSION AND SEDIMENT CONTROL.
Mel D. Powell, William C. Winter, and William P. Bodwitch. 1970, 68p W70-06574, FWPCA-15030-DTL-03/70

Descriptors: (*Water pollution, Control), (*Soils, Erosion), Sedimentation, Drainage, Law, Statistical data, Sources, Budgets, Organic materials, Particles, Transport properties, Rivers, Money, Standards, Handbooks, Floods.
Identifiers: Community planning, *Soil erosion, *Stream pollution.

Erosion and sediment, once thought of as rural problems, are causing extensive damage to the soil and water resources of developing communities. Sediment caused by careless development and construction has become one of the Nation's most serious sources of water pollution. This guidebook is intended to help local officials to organize, plan, finance, staff, and implement comprehensive sedimentation control programs. In addition, it should help local officials and administrators understand what is basically a technical problem; it will also help soil and water experts and technicians understand the administrative aspects of sedimentation control. This mutual understanding is necessary if effective control is to be achieved. The concepts and principles presented are based on a year of research, including visits to federal and state agencies and 14 visits to local sedimentation control programs across the United States. A model approach, with appropriate modifications, may be used by many local governments to control their sedimentation problems. (WRSIC abstract)

ADVANCES IN THE USE OF MICROWAVE POWER.
W. A. Geoffrey Voss. 1970, 32p* Seminar Paper-008

Descriptors: (*Microwave equipment, Reviews), (*Heaters, Microwaves), Engineering, Radiofrequency power, Safety, Attenuators, Radiofrequency, Radiobiology.
Identifiers: *Microwave ovens.

The industrial and domestic use of microwave power, as a source of heat, is increasing. The physical advantages of microwave heating, and the methods used to apply this form of energy in the processing industries are discussed. The need for a closer cooperation between the electronic systems designer and the environmental scientist is emphasized. Both have the responsibility of studying the biological effects of high frequency energy and ensuring the safety of operating personnel. The design of wavetraps and door seals will be considered in detail. Methods of both preventing and measuring leakage power in the microwave frequency spectrum is discussed. (Author)

DILUTE SPENT KRAFT LIQUOR FILTRATION THROUGH WOOD CHIPS.
Water pollution control research series.

Apr 70, 36p W70-06961, FWPCA-12040-EZZ-04/70
Grant WPRD-115-01-68

Descriptors: (*Paper industry, *Water pollution), (*Filters (Fluid), *Wood), Wood pulp, pH, Organic materials, Purification, Wastes (Industrial).
Identifiers: Chips, *Kraft wood pulps, *Pine wood, Biochemical oxygen demand.

The principal objective of this project was to determine if contact between effluent from a Kraft pulp mill and pine chips would reduce the water pollution characteristics of the waste liquor. The experimental work was divided into two phases: (1) a small scale laboratory investigation of contacting dilute waste liquor with chips; (2) a pilot-scale investigation of filtering waste liquor through a column and a pile of chips. It was found that contact of alkaline waste liquor, or even distilled water, with pine chips extracted organic matter from the chips which had a considerable BOD. This extract corresponded to a pollution load of about 3-11 lbs. BOD per ton of dry wood. Alkalinity, pH, and intensity of color of the waste liquor were somewhat reduced by the contact. These reductions are, however, too small to have any practical application in effluent treatment. It can, in general, be concluded that contact of alkaline waste liquor, or water, with wood chips extracts soluble organics and adds pollutional materials to the effluent stream. (Author)

ELKINS MINE DRAINAGE POLLUTION CONTROL DEMONSTRATION PROJECT,
Ronald D. Hill. 20 May 70, 21p W70-06965, FWQA-14010-04-70
Presented at Symposium on Coal Mine Drainage Research (3rd) Mellon Inst., Pittsburgh, Pa., 20 May 70, p284-303.

Descriptors: (*Water pollution, Control), (*Underground structures, Drainage), Coal, pH, Surfaces, Terrain, Reclamation, Plants (Botany), Seals, Inland waterways, Effectiveness, Contamination.
Identifiers: Elkins (West Virginia), *Acid mine drainage, *Land reclamation, Roaring Creek, Watersheds, Grassy Run, Strip mines, Stream abatement.

In 1964, a mine drainage pollution control demonstration project was undertaken near Elkins, West Virginia. The area contained a large drift mine (3,000 acres) which had been extensively surface mined along the outcrop. The objective of the project was to determine the effect on the water quality of 'air' sealing and diverting water away from the underground mine and reclaiming the surface mines. Some 450 subsidence holes were filled, over 12.5 miles of surface mines were reclaimed and 101 seals constructed. Approximately 640 acres of land were disturbed during reclamation which were revegetated in the spring of 1968. This paper reports the effectiveness of the reclamation work for the first two years following construction. The reclamation and revegetation of the surface mines and refuse piles have shown some benefits, however, an equilibrium condition has not been established and the long term effects have yet to be determined. While some areas have shown trends of continued improvement, others showed an improvement the first year, followed by some deterioration the second year. Air sealing, under the conditions at Elkins was unsuccessful, except for one site, the oxygen concentration behind the seal has not decreased and the pollution loads have not decreased. For the combined watershed of Roaring Creek and Grassy Run there has been over a 1,500 ton decrease in the acidity load for the base year 1966. However, none of the streams in either watershed has returned to its unpolluted state. (WRSIC abstract)

PRODUCT TESTING AND EVALUATION OF GIANT VIEW (TRADE MARK) TV PROJECTOR,
Paul S. Ruggera. May 70, 32p* BRH/DEP-70-9

Descriptors: (*Television display systems, Radiation hazards), Cathode ray tubes, Shielding, Data, Measurement.

The report presents x-radiation data recorded from the kinescope of a projection television unit. The model tested had a moveable kinescope housing which, when extended, essentially removed the shielding effect of the cabinet. Measurements were made under typical operating conditions, and these were related to the two extremes of kinescope position. In addition, a leaded kinescope of the same type was substituted, and data showing the relationship between the lead content of the glass envelope and the emission rate are reported. (Author)

LEAKAGE VARIATIONS FROM MICROWAVE OVENS.
Jun 70, 33p BRH/DEP-70-11

Descriptors: (*Cooking devices, Microwaves), Radiation hazards, Test methods, Seals.
Identifiers: *Microwave ovens.

Some microwave radiation leakage is generally associated with the operation of microwave ovens. This leakage usually occurs around the door seals and varies with the type, size, and placement of food or other loads within the oven cavity. This report describes field and laboratory studies that were performed to determine the most important variables and their effect on microwave oven radiation leakage levels. Additional field observations of ovens in use should be conducted to more clearly define the correlation between food types, sizes, and placement, and door closing and opening procedures. (Author)

NEUTRALIZATION OF HIGH FERRIC IRON ACID MINE DRAINAGE,
Roger C. Wilmoth, and Robert B. Scott. 19 May 70, 29p W70-07149, FWQA-14010-05/70
Presented at Symposium on Coal Mine Drainage Research (3rd), Pittsburgh, Pa. 19 May 70.

Descriptors: (*Mining engineering, Wastes (Industrial)), (*Wastes (Industrial), Neutralization), Inorganic acids, Iron, Drainage, Water pollution, pH, Limestone, Calcium oxides, Sodium compounds, Carbonates.
Identifiers: *Mine waters, Sodium carbonates, Coal mines.

The Norton Mine Drainage Field Site of the Federal Water Quality Administration has been conducting research on the feasibility of acid mine drainage treatment using lime, limestone, and soda ash neutralization. The Norton research facility is located at Norton, West Virginia, on the banks of Grassy Run--a small, heavily polluted stream of which an estimated 90% of the water flow is from abandoned mines. Tests were run on identical samples of Grassy Run water to determine the quality of the supernatant when the sample was neutralized to various pH's. Lime, limestone, and soda ash were each tested as the neutralizing agents. All 3 neutralizing agents--lime, limestone, and soda ash--can meet the pH 6.5, net alkalinity, iron below 7.0 ppm criteria with relative ease. The major differences between soda ash neutralization and lime or limestone neutralization are that soda ash produces low hardness, low calcium, high sodium, and high cost, whereas all other chemical parameters are comparable between the 3 neutralizing agents. Descriptors: (*Air pollution, Bibliographies), United States, Government (Foreign), Control, Chemistry, Physics, Biochemistry, Inventory, Effectiveness, Animals, Humans, Materials, Sources, Meteorology.

Information about 1383 projects active in calendar year 1969 was compiled from respondents to a questionnaire. The compilation has three main parts. (1) The project listing for United States projects are arranged alphabetically by States, and for foreign projects they are arranged alphabetically by country. Within each geographic location, the listing is further alphabetized by performing organization. Each entry also includes the project title, name of the investigator and address, the sponsor, and the type of support. The entries are numbered sequentially with 'project numbers'. (2) The categorical listing or subject index, is arranged alphabetically by 19 subject categories. Within each category, the listing is further alphabetized by project title. Following each project title, its project number appears. (3) The principal investigator listing or index is arranged alphabetically. Following each investigator's name, the project number and citations of publications and presentations resulting from the project appear. (Author)

ATMOSPHERIC EMISSIONS FROM WET--PROCESS PHOSPHORIC ACID MANUFACTURE.
Apr 70, 98p NAPCA-Pub-AP-57
Paper copy also available from Superintendent of Documents, GPO, Washington, D. C. 20402. Price $0.45 as HE20.1309:57. Prepared in cooperation with Mfg. Chemists' Association, Inc.

Descriptors: (*Chemical industry, Air pollution), (*Air pollution, *Phosphoric acids), (*Fluorides, Air pollution), Ores (Nonmetallic), Silicon compounds, Hydrogen compounds, Dust, Sampling, Spectroscopy.
Identifiers: Silicon tetrafluoride, Hydrogen fluoride, Chemical plants, Scrubbers.

Wet-process acid is produced by treating fluorapatite (Ca10 (PO4)6F2) or phosphate rock, with sulfuric acid. Phosphate rock must be finely ground to react properly with sulfuric acid, and standard control equipment is normally used to prevent objectionable dust emissions. The emissions of most concern are fluoride compounds liberated from the rock by the sulfuric acid. These consist of hydrogen fluoride, silicon tetrafluoride, and some products of reaction and decomposition of the latter. Most phosphate rock contains 3.5 to 4 percent fluorine, and half of this may be volatilized in the processing. This represents a large potential source of pollution. Because of the principal atmospheric contaminants generated in the process are gaseous fluorides, vapor scrubbing is universally employed to control emissions. Specific devices used for control include venturi scrubbers, impingement scrubbers, and various kinds of spray towers. The results of MCA-PHS stack tests on ten wet-process phosphoric acid plants in various parts of the country are tabulated. The major source of gaseous fluoride emissions in wet-process phosphoric acid plant is the digester. Only trace quantities of particulate fluorides are normally present in exit gases from digesters and filters, and these can be removed effectively by scrubbing. (Author)

CHARACTERISTICS OF PARTICULATE PATTERNS, 1957-1966,
Robert Spirtas, and Howard J. Levin. Mar 70, 105p NAPCA-Pub-AP-61
Errata sheet inserted. Paper copy also available from Superintendent of Documents, GPO, Washington, D. C. 20402. Price $0.50 as HE20.1309:61.

Descriptors: (*Air pollution, Particles), (*Dust, Air pollution), Periodic variations, Urban areas, Rural areas, Sampling, Meteorological parameters.

The National Air Surveillance Networks (NASN) have collected samples of suspended particulate matter since 1957. The resulting suspended particulate data are graphically summarized by the application of Whittaker-Henderson Type A curve-smoothing formulas to 10 years of data. Data from 60 urban stations and 20 nonurban stations were studied by this technique, which brings out the underlying cyclical patterns and long-term trends in nationwide levels of suspended particulate matter. Seasonal patterns are evident for many urban and nonurban stations, and the seasonal characteristics of the two types of stations contrast sharply. Long-term trends are downward at many center-city urban sites, but are upward at some nonurban sites. (Author)

SENSORY EVALUATION OF DIESEL EXHAUST ODORS,
Amos Turk, Janet T. Wittes, L. R. Reckner, and R. E. Squires. Feb 70, 64p
Contract PH-27-66-96, PHS-CPA-69-528
Prepared in cooperation with Harvard Univ. Cambridge, Mass. and Scott Research Labs., Inc. Perkasie, Pa. Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $0.70 as HE 20-1309:60.

Descriptors: (*Air pollution, Diesel engines), (*Diesel engines, Exhaust gases), (*Exhaust gases, Odors), (*Odors, *Sensory perception), Humans, Detection, Tests, Intensity, Standards, Statistical analysis, Air, Purification.

Exhaust gases emitted by diesel engines are characterized by offensive odors, which can be rated numerically by human judges. Correlation of such ratings with the chemical composition of diesel exhaust will aid in (1) establishing Federal standards for diesel exhaust emissions and (2) developing methods of diesel odor control. Part 1 presents instructions for the training of judges to rate the odors in terms of intensity and quality standards provided to them for reference. Part 2 describes the physical arrangement of an exhaust dilution and panel exposure system. It describes the performance of odor evaluation tests, design of test programs, and statistical analysis of test data. Appendices describe (A) the theoretical basis for air purification requirements in test chambers, (B) composition and makeup of diesel odor standards, and (C) mathematical derivations of the statistical procedures. NATIONAL INVENTORY OF SOURCES AND EMISSIONS: CADMIUM, NICKEL, AND ASBESTOS - 1968. CADMIUM, SECTION I.
Feb 70, 53p* APTD-68
Contract PHS-CPA-22-69-131
See also Section 2, PB-192 251 and Section 3, PB-192 252.

Descriptors: (*Air pollution, *Cadmium), (*Industries, Air pollution), Sources, Wastes (Industrial), Cadmium compounds, Metallurgy, Industrial plants, Mining engineering, Zinc, Lead, Copper, Metals, United States, Industrial production, Batteries + components.
Identifiers: *Emission inventory, *Source inventory.

The aim is to provide reliable information regarding the nature, magnitude, and extent of the emissions of cadmium in the United States for the year 1968. Background information concerning the basic characteristics of the cadmium industry has been assembled and included. Process descriptions are given, but they are brief, and are limited to the areas that are closely related to existing or potential atmospheric losses of the pollutant. The apparent consumption was 13.3 million pounds, and domestic production 10.6 million pounds. Only a small amount of cadmium was recovered from scrap. Emissions to the atmosphere during the year totaled 4.6 million pounds. Emissions from the metallurgical processing plants of the primary producers of cadmium, zinc, lead, and copper were more than 2 million pounds, and those from melting operations in the iron and steel industry were about the same. Emission estimates for mining, metallurgical processing, and reprocessing operations are considered to be reasonably accurate. They are based on data obtained by personal contact with the processing and reprocessing companies. (Author)

The aim is to provide reliable information regarding the nature, magnitude, and extent of the emissions of nickel in the United States for the year 1968. Background information concerning the basic characteristics of the nickel industry has been assembled and included. Process descriptions are given, but they are brief, and are limited to the areas that are closely related to existing or potential atmospheric losses of the pollutant. Consumption for the year was reported to be 159,306 tons and domestic production to be 29,215 tons including the production from both primary and secondary sources. Imports, mostly from Canada, totaled 147,950 short tons. Emissions to the atmosphere during the year were 6,475 short tons. About 83 percent of the emissions were due to the burning of heavy fuel oil and coal. Estimates of emissions for mining, metallurgical processing, and reprocessing operations are based on data obtained by personal contact with processing and reprocessing companies, and are considered to be reasonably accurate. Identifiers: *Emission inventory, *Source inventory.

The aim is to provide reliable information regarding the nature, magnitude, and extent of the emissions of asbestos in the United States for the year 1968. Background information concerning the basic characteristics of the asbestos industry has been assembled and included. Process descriptions are given, but they are brief, and are limited to the areas that are closely related to existing or potential atmospheric losses of the pollutant. The apparent consumption for the year was 817,363 tons and the domestic production was only 120,690 tons. Imports, mostly from Canada, totaled 737,909 short tons. There was no recovery from scrap. Emissions to the atmosphere during the year were 6,579 tons. About 85 percent of the emissions were due to mining and milling operations. Estimates of emissions are based for the greatest part on observations made during field trips, and on the limited information provided by mining, milling, and reprocessing companies. Information was not available regarding the magnitude of the emissions or the particulate size. There were no emission records at any of the locations visited. (Author)

THE CHARACTERISTICS AND POLLUTIONAL PROBLEMS ASSOCIATED WITH PETROCHEMICAL WASTES.
Summary rept.,
Earnest F. Gloyna, and Davis L. Ford. Feb 70, 107p* W70-07511, FWPCA-12020-2/70
Contract DI-14-12-461

Descriptors: (*Water pollution, *Petroleum industry), (*Wastes (Industrial), Water pollution), Industrial plants, Water supplies, Costs, Control, Oxidation, Effectiveness.
Identifiers: *Water treatment, *Biochemical oxygen demand.

Each of the major processes developed by the industry should be studied with the objective of evaluating the trends in plant locations, effects on area-wide water quality, and treatment requirements. Since there will be no significant changes in petrochemical feedstocks, the patterns of feedstock usage should be monitored and major changes evaluated in terms of the water use and water reuse requirements, potential pollution problems, and product development. Because the main contribution to environmental pollution from the petrochemical industry emanates from process waste streams, comparative cost analyses should be made on typical recycle (feedstock) practices and on associated wastewater treatment requirements. Master plans for in-plant wastewater collection should include facilities to segregate process waste from less contaminated streams. Problem areas in the physical, chemical and biological treatment processes, as well as disposal methods, are listed. A detailed and basic study should be initiated to evaluate the cost of treating wastes from single plants or process streams with combined wastes from several plants. (Author)

STUDY OF UNCONVENTIONAL THERMAL, MECHANICAL, AND NUCLEAR LOW-POLLUTION-POTENTIAL POWER SOURCES FOR URBAN VEHICLES.
Summary rept. 17 May 67-15 Mar 68,
J. A. Hoess, E. S. Cheaney, F. A. Creswick, D. A. Trayser, and R. D. Fischer. 15 Mar 68, 171p
Contract PH-86-67-109

Descriptors: (*Passenger vehicles, Power equipment), Nuclear energy, Heat engines, Air pollution, Specifications.

The purpose of the program was to provide background information and recommendations required for development of future research and development programs on low-pollution-potential propulsion systems for urban vehicles. The study itself consisted of a first screening of possible alternative systems to identify those that were the most promising so that future efforts could be concentrated on these. So as not to screen out systems that could be enhanced through directed research and development efforts, alternative systems were evaluated on the basis of the characteristics that they could be expected to have 10 to 15 years in the future, assuming that development efforts were expended on them. As a result of the study, a few alternative propulsion systems have been identified as being quite promising for urban-vehicle application, while a large number of systems were found to be unsuitable for such application. THE EFFECT OF INSTRUMENT AVERAGING TIME ON MICROWAVE POWER DENSITY MEASUREMENTS.
Jun 70, 35p BRH/DEP-70-12

Descriptors: (*Radiometers, Microwave equipment), (*Radiation hazards, Microwaves), Radiofrequency power, Density, Measurement, Accuracy, Sensitivity.

The response of the Narda 8100 system to a stepped input of microwave power was measured with a video tape recorder. The Narda 8100 was then used to measure variations in microwave power density due to 'mode stirring'. This report discusses the averaging effect caused by the response time of the instrument system on the observed power density. Examples of averaged values of power density from microwave ovens are included. (Author)

WATERS FOR WATERFLOODING SAN JOAQUIN VALLEY, CALIF., PETROLEUM RESERVOIRS.
Rept. of investigations,
George Laurence Gates, and W. H. Caraway. Jun 70, 22p RI-7401

Descriptors: (*Petroleum, Production), (*Rock (Geology), Water injection), Water, Sources, California.
Identifiers: *Waterflood oil recovery, Oil recovery, San Joaquin Valley (California), *Reservoir engineering.

Five possible sources of water for waterflooding of petroleum reservoirs in the arid San Joaquin Valley of California were considered. Three of them (water produced with petroleum, water from a shallow saline aquifer, and waste irrigation water) were analyzed chemically; laboratory information for one (sea water) had been developed during a previous study. A series of laboratory tests made on the fifth source (fresh water) determined the solubility of calcium sulfate dihydrate in water. Laboratory analyses included the following: Chemical analyses of water produced with petroleum and waste irrigation water; solubility of calcium sulfate dihydrate in water and brines; the effect of excess sulfate on the solubility of calcium sulfate in brines; the presence of sulfate-reducing bacteria; and the permeability of cores from a petroleum reservoir to air, to water from other petroleum reservoirs, and to waste irrigation water. The results showed that most of the waters and mixtures of waters are compatible with petroleum reservoir waters and are generally suitable for injection. The calcium content of some of the formation waters is quite high, and care must be taken to prevent precipitation of calcium sulfate dihydrate. The permeability of the few cores tested was about the same to water and brines as to air, indicating that formation damage due to clay swelling will not be serious. The waters most likely to be available for injection are water produced with petroleum, water from shallow saline aquifers, and waste irrigation water. (Author)

INQUIRY INTO THE ECONOMIC EFFECTS OF AIR POLLUTION ON ELECTRICAL CONTACTS.
Final rept.,
Robert C. Robbins. Apr 70, 101p APTD-67
Contract PH-22-68-35

Descriptors: (*Air pollution, Electric connectors), (*Electric connectors, Reliability (Electronics)), Failure (Electronics), Economics, Inhibition, Corrosive gases, Decontamination, Metal coatings.
Identifiers: *Electric contacts.

Prevention of contact failure in low voltage contacts is the largest problem. Millions of low voltage contacts are used in computer and instrumentation circuits, and some provision must be made to ensure their reliable and continued operation. The sulfur gases are primarily responsible for the deleterious effect of air pollution on these contacts. More money is spent in the protection of low voltage contacts against the effects of sulfur gases than in all the other contact problem areas combined. Protection of low voltage contacts against sulfur gases takes two forms: the use of air conditioning and air purification equipment; the other kind of protection of contacts against sulfur gases is precious metal plating. The cost relating to failure of electrical devices caused by air pollution for 1968 is estimated to be about $64 million in the United States. Reducing current air pollution by 50 percen6 would have little effect on air pollution costs related to electrical devices, because any reduced level of recognized air pollution would still require that measures taken to combat air pollution effects be continued at the same level of effort. Industry does not know the amount of air pollution reduction needed to appreciably reduce the damaging effects on electrical contacts. (Author)

ULTRASONIC EMULSIFICATION OF OIL TANKER CARGO.

Apr 70, 17/p* W70-07996, FWQA-15080-DJQ-04/70

Descriptors: (*Petroleum, *Colloids), (*Oil, *Water pollution), (*Tankers, Petroleum), Fishes, Costs, Ultrasonic radiation, Safety, Films, Toxicity.
Identifiers: *Oils pollution, *Oil slicks, *Emulsification, *Water pollution control equipment, Dispersing.

The purpose of this project was to study the feasibility of producing emulsified oil at a rate comparable with conventional tanker loading rates and to investigate the economic and ecological factors. To determine blender design parameters and emulsified oil characteristics, two crude oils and one fuel oil were chosen. A Libyan light oil, a Venezuelan oil and no. 6 Fuel Oil were used. Only two emulsifiers were used and they were base-neutralized sulfonated nonionics. These are compatible with sea water and of low toxicity. The emulsions tested were oil-in-water. Oil was the internal phase and 97% of the total. Water and chemical was the external phase and 3% of the total. The tests on the emulsions were to determine: stability under simulated transportation conditions, dispersibility in sea water, toxicity to fish, and product alteration. Included were tests with safety aspects: evaporation rates, flash points, vapor pressures and rupture leak tests. An economic study was made which shows emulsification costs of about 20 cents per barrel without considering possible offsets or side benefits. (Author)

STATE OF THE ART REVIEW ON PRODUCT RECOVERY.

Nov 69, 113p* W70-07997, FWQA-17070-DJW-11/69
Contract FWPCA-14-12-495

Descriptors: (*Wastes (Industrial), Recovery), (*Water pollution, Wastes (Industrial)), (*Reviews, Water pollution), Electrodialysis, Ion exchange, Solvent extraction, Control, Economics, Taxiing, Paper industry, Steel industry, Mining engineering, Petroleum industry, Textile industry, Chemical industry, Nuclear power plants, Fertilizers, Plating, Evaporation, Adsorption, Distillation, Chemical precipitation.
Identifiers: Filtration, *Water pollution control equipment.

The recovery, reuse and sale of materials from liquid effluents, or produced as a result of the treatment of liquid effluents is discussed. A critical review of literature up to date on product recovery in major water use industries is presented. The economical, technical and philosophical framework which determines the application of product recovery is presented wherever possible. This report does not cover water renovation for reuse and product recovery from solid wastes. However, an evaluation of the utilization and product recovery of municipal sludge is presented. The principal areas of discussion are waste reduction practices including in-plant control, recovery techniques and practices, practical operating problems and the relationship between recovery and treatment. It is concluded that product recovery is an accepted practice with increasing usage; industry needs increasingly complex processes to develop optimum recovery schemes; by-product recovery results in a net cost to industry generally of a smaller magnitude then conventional treatment; and the situation is complicated by the tax exemption laws. INSTREAM AERATION OF POLLUTED RIVERS,
William Whipple, Jr., Joseph V. Hunter, Burton Davidson, Frank Dittman, and Shaw Yu. Aug 69, 209p* FWPCA-16080-DUP W69-09555, OWRR-A-999-NJ (5)

Descriptors: (*Water pollution, New Jersey), (*Rivers, Decontamination), Oxygen, Air, Quality control, Simulation, Photosynthesis, Test equipment, Wastes (Sanitary Engineering), Protection, Contamination, Wastes (Industrial), Feasibility studies, Costs.
Identifiers: *Passaic River, *BOD (Biochemical Oxygen Demand), Biochemical oxygen demand, *Water quality, *Aeration.

Mechanical and diffuser instream aerators were tested on the Upper Passaic River and proved a practical and economical method of adding dissolved oxygen to polluted streams. The tests were conducted in conjunction with research into photosynthesis, benthal oxygen demand, and mass balance of BOD in that river system. Systems of aerators were designed to provide for meeting water quality objectives of dissolved oxygen, and cost estimates made. Alternative costs of meeting the same objectives by means of advanced effluent treatment alone appear to be several times as great. It is concluded that instream aeration may provide a feasible alternative to advanced waste treatment for polluted rivers, as a supplement to secondary waste treatment. (WRSIC abstract)

VARIABILITY IN THE AUTOMATIC PROCESSING OF MEDICAL X-RAY FILM,
John P. Fergusen, and Warren W. Schadt. Jun 70, 44p* DEP-70-13

Descriptors: (*Photographic film, Processing), (*X-ray photography, Photographic film), Automation, Medicine, Diagnostic agents, Radiography, X rays, Health physics, Public health, Periodic variations.

Equally exposed films were developed in 26 automatic processors. Films were developed in 22 of these processors, one film per week for 3 consecutive weeks. The percent standard deviations of the film base-fogs, relative speeds, and average gradients were respectively 18, 12, and 4 percent. Films were developed in the other four processors on a daily basis for one-month period. During this time, two of the processors required major servicing because of mechanical and chemical malfunctions. The percent standard deviations of the base-fog for the films developed in these two processors were 39 and 51 percent. For the other two processors, the percent standard deviations in the base-fog were both 11 percent. (Author)

PLANKTON COMMUNITY AND HYDRAULIC CHARACTERIZATION PRELIMINARY TO LAKE FLUSHING.
Final rept.,
Eugene B. Welch, Ronald J. Buchanan, Ronald E. Nece, and Richard H. Bogan. Oct 69, 188p W70-08166, FWQA-16010-10/69

Descriptors: (*Water pollution, Lakes), (*Lakes, Plankton), Nutrition, Control, Distribution, Hydraulic models, Mathematical models, Algae.
Identifiers: *Eutrophication, *Water treatment, *Moses Lake, *Flushing.

The effect was evaluated of adding varying amounts of low-nutrient flushing water to one area of Moses Lake, a 6,500-acre highly eutrophic lake in eastern Washington. Cluster analysis of plankton data identified 6 sample groups and species groups. Temporal and spatial variations in community types and standing crops appear to be related to detention time, nitrate content, and available light. The effect of low-nutrient dilution water on lake plankton growth response indicated growth at 90% and 86% lake water. Dye studies, diurnal plankton sampling, and field observations indicate that southerly winds have a great effect on moving algae upstream into upper Parker Horn. Water movements in the lake could be simulated in a distorted Froude law hydraulic model. Removal of algae and nutrients by flushing procedures in Parker Horn and the lower lake would likely be more effective at night. Moses Lake behaves both biologically and hydraulically as though it were divided into several partially isolated regions. A tentative mathematical model has been set up for simulating the productivity and distribution of algae. Flushing Parker Horn with large slugs of low nutrient water may not be effective because of wind action transporting algae and their entrained nutrients back into the Horn together with nutrient regeneration from sediments. (WRSIC-abstract)

A GENERALIZED COMPUTER MODEL FOR STEADY-STATE PERFORMANCE OF THE ACTIVATED SLUDGE PROCESS,
Robert Smith, and Richard G. Eilers. Oct 69, 137p W70-08165, FWQA-17090-10/69

Descriptors: (*Sewage, Mathematical models), Computer programs, Oxidation, Bacteria.
Identifiers: *Activated sludge process, Waste water treatment, Nitrification, Biochemical oxygen demand, Aeration, *Sewage treatment.

Mathematical models used to represent the activated sludge process are examined; means of analysis and computation of the differences and similarities between models are investigated. Two digital computer programs have been developed. The first program, the Continuous Steady State Activated Sludge (CSSAS) is a steady state model of the conventional activated sludge process flexible enough to simulate any of the proposed models. The second digital program Fill and Draw Activated Sludge (FADAS) attempts to simulate the biological activity in a fill and draw bench experiment in which activated sludge is mixed with substrate in any proportions. The FADAS program which has not been validated will be useful in interpretation of bench scale fill-and-draw experiments. The CSSAS program represents the most complete state-of-the-art computational procedure for quasi-steady-state performance of the ac-

tivated sludge process but some important questions relating to design and operation of the process remain unresolved. However, further experimentation should ultimately result in a thoroughly reliable design tool. (WRSIC-abstract)

SPREADING AND MOVEMENT OF OIL SPILLS.
Water pollution control research series,
Henry G. Schwartzberg. Mar 70, 111p*
FWQA-10580-EPL-4/70, W70-08163
Contract FWPCA-01342-01A

Descriptors: (*Water pollution, *Petroleum), Water waves, Drift, Wind, Ocean currents, Fuel oil.
Identifiers: *Oil pollution, *Oil slicks, Windward drift, Wind velocity, Spreading.

The spreading and movement of oil spills on water were investigated. Areas for spills which form lenses were measured and correlated. Most crudes tested formed thin films, not lenses; but lens formation could be induced and spreading greatly reduced by surfactant treatment. Spreading rates for small spills were measured and correlated with spill volume, oil density and water viscosity. Field data and energy conservation, however, indicates that these aspects of small spills cannot be scaled up to large spill volumes. Wind-water basin tests indicated that on quiet open water oil should drift windward at 3.66% of the wind velocity. The percentage drift was not significantly affected by oil or water properties, depth, and wind speed, and agrees fairly well with field data. Waves caused significant reductions in wind drift, but in the shallow basin used did not induce significant drift themselves. Since wind causes waves, and deep water waves cause drift, further investigation of wind and wave drift interaction is recommended. Wind drift was found to be confined to a thin surface layer. The use of 1 - 1 1/2 inch deep oil-confining drogues markedly reduced wind drift. Investigation of the use nets of such drogues and of lens formation to reduce oil spread and movement is recommended. PROPERTIES OF LIQUID CRYSTALS AND THEIR APPLICATION TO THE MEASUREMENT OF MICROWAVES AND INFRARED RADIATION.
14 Mar 69, 27p* Seminar paper-009
Presented at National Center for Radiological Health's Seminar Program, Rockville, Md., 14 Mar 69.

Descriptors: (*Detectors, Liquids), (*Infrared detectors, Liquids), Reviews, Microwaves, Crystals, Cholesteryl esters, Imines, Colors, Electric fields, Heat.
Identifiers: *Liquid crystals, Nitro compounds, *Microwave radiation hazard detectors.

Molecular geometry is shown to be important in interpreting the properties of thermotropic liquid crystals. The present 'state of the art' is discussed and a description of how one can build molecules which will possess certain properties needed for specific applications is included. Certain aspects of molecular geometry are considered. Optical and structural properties of the different types of liquid crystals are explained with an emphasis on the use of these properties in the practical applications of liquid crystals. Both thermotropic and lyotropic liquid crystals are included in these deliberations. Applications of liquid crystals are directly related to the use of cholesteric esters which show color change as a function of temperature. Brief mention is made of the use of neumatic liquids which show strong response to electric and magnetic fields. (Author)

INVESTIGATION OF THE RESPONSE OF THE MICROLITE 287 PROBE TO MICROWAVE FIELDS.
Herbert F. Kein, Mays L. Swicord, David G. Brown, and Robert L. Moore. Aug 70, 54p BRH-DEP-70-20

Descriptors: (*Cooking devices, Microwaves), (*Leakage (Electrical), Detection), (*Probes (Electromagnetic), Performance (Engineering)), Radiofrequency power, Mercury, Neon, Autoignition.
Identifiers: Microlite 287 probes, *Microwave ovens.

The report describes tests performed on the Microlite 287 microwave oven leakage probe under laboratory and field simulated conditions. The probe contains a preignited mercury-neon gas which ionizes and glows in the presence of radiofrequency energy. The probe-to-probe variability and the difficulty encountered in observing the change in glow intensity seriously limit the usefulness of the probe as a measurement device. It may be useful as a device for detecting gross microwave oven leakage. (Author)

A COMPREHENSIVE BIBLIOGRAPHY OF ELEMENT 44, RUTHENIUM.

1970, 1956p* BRH/CFS-70-1
Includes Section 1A thru Section 4, Appendix A thru Appendix C.6. Availability: 16mm microfilm only after stock exhausted.

Descriptors: (*Ruthenium, *Bibliographies), (*Radiological contamination, Ruthenium), Radioactive waste, Complex compounds, Ruthenium compounds, Water pollution, Indexes, Metabolism, Toxicity, Chemical reactions, Radiobiology.

The bibliography enumerates those papers in the open scientific literature through 1963 that deal with ruthenium, and represents a practical attempt to completely record the literature dealing with ruthenium. References are included that report relevant biological, chemical, and physical properties of the metal, its many chemical compounds, or

its complexes. The report is arranged in four major parts: Index in which keywords-in-context (KWIC Index) from each title have been arranged alphabetically down the center of the column; Bibliographic citations arranged alphabetically by last name of principal author; Cross-index of all author names arranged alphabetically for all references cited; and Cross-index containing more than 200 U.S. and foreign patents related to uses of ruthenium and offering direct access to the patent literature citations. STUDY OF CONTINUOUS FLOW COMBUSTION SYSTEMS FOR EXTERNAL COMBUSTION VEHICLE POWERPLANTS.
Final rept.,
C. V. Burkland, W. B. Lee, G. Bahn, and R. Carlson. Jun 70, 168p* APTD-0574
PHS-CPA-22-69-128

Descriptors: (*External combustion engines, *Air pollution), Exhaust gases, Combustion deposits, Fuel injectors, Combustion chambers, Heat exchangers, Test methods, Sampling, Samplers, Gas analysis, Rankine cycle, Design.

Chemical kinetic studies were employed to better understand how and at what rate air pollutants are formed in an external combustion process. With this background, an experimental combustion test rig employing a recirculating step, staged burner was built. Tests were conducted with various liquid and vaporized liquid fuel injectors using aviation turbine fuel (Jet A) and 2,2,5-trimethylhexane. A wide range of fuel-air ratios were examined by individually controlling primary and secondary air flow rates. Fuel flows were varied from a maximum corresponding to a heat release of 500,000 BTU/hr to 1/30 of this value. Two runs were also made using gaseous methane fuel. The range of test variables were: injector configurations - pressure atomizing, vaporizing, 2nd vaporizing premixed; fuel flows from 0.15 to 4.5 gallons per hour; air flows from 3.4 to 103 standard cubic feet per minute; fuel equivalence ratio - primary from 0.53 to 1.59, and overall from 0.40 to 0.84; number of test conditions - 140; and cumulative combustion time - 22 hours. The tests demonstrated that gaseous and particulate emissions less than those established as the 1980 Federal Research goals can be achieved simultaneously in a high heat release, low pressure drop, burner configuration. The emission data measured at steady state conditions is compared to current and future emission goals for automobiles. (Author)

CONCEPTUAL DESIGN, RANKINE-CYCLE POWER SYSTEM WITH ORGANIC WORKING FLUID AND RECIPROCATING ENGINE FOR PASSENGER VEHICLES,
Dean T. Morgan, and Robert J. Raymond. Jun 70, 237p* TE4121-133-70
Contract PHS-CPA-22-69-132

Descriptors: (*External combustion engines, *Rankine cycle), (*Passenger vehicles, External combustion engines), Internal combustion engines, Performance (Engineering), Statistical analysis, Fuel consumption, Combustion chambers, Automatic transmissions, Regenerative cooling, Condensers (Liquefiers), Exhaust gases, Cost effectiveness, Thiophenes, Rotary seals, Air pollution, Reduction.
Identifiers: Rankine cycle engines, Organic ranking cycle engines, Automobile engines.

A conceptual design was prepared of a Rankine-cycle power system with organic working fluid and reciprocating engine for a low-emission automotive propulsion powerplant. The goal of the study was development of a system competitive in cost, performance, and driver convenience with the internal combustion engine system using current technology wherever possible. The component designs and characteristics are presented. The complete 100 net shaft horsepower system is packaged in the engine compartment of a late model sedan; the predicted performance characteristics are presented. The system is closely competitive, in 0 - 60 mph acceleration time and in level-grade top speed, with a 302 cubic inch displacement internal combustion engine with three-speed transmission. The fuel economy in customer-average mpg is approximately 20% less than the 302 cubic inch internal combustion engine. The use of thiophene as a working fluid, with a moderate maximum cycle temperature of 550F, permits a significant cost reduction relative to the equivalent steam system. Projection of current burner data indicates a strong potential for emission levels significantly less than the projected 1980 federal standards for all three of the major pollutants: unburned hydrocarbons, carbon monoxide, and nitric oxide. STUDY OF COST OF SULPHUR OXIDE AND PARTICULATE CONTROL USING SOLVENT REFINED COAL,
Robert G. Shaver. Apr 70, 72p* APTD-0575
Contract PHS-CPA-22-69-82

Descriptors: (*Air pollution, *Combustion products), (*Coal, Air pollution), (*Sulfur, *Reduction (Chemistry)), Separation, Chemical engineering, Costs, Economics, Organic solvents.
Identifiers: *Sulfur dioxide, *Desulfurization, Solvent refining, Bituminous coal.

The primary purpose was to display the cost analysis data in such a way that it is readily adaptable to a large variety of real or hypothetical situations of heat or power generation so that direct comparisons can be made of the pollution control cost in specific situations by the use of solvent refined coal to that of any other projected system for which control cost information is available. The heat content of SRC is considerably higher than the coal from which it is made and hence shipping costs are lower on an equivalent thermal basis. This is approximately 16,000 Btu/lb, which exceeds high quality anthracite or bituminous coal. Combustion chamber corrosion and slagging problems are directly reduced by its use. Since solvent refined coal can be liquified by heating and/or increasing its residual solvent oil content, there exists the option of firing as solid coal or as fuel oil. Lastly it is essentially a 'fail-safe' pollution control process so far as the combustion unit is concerned, since no unusual SO2 pollution can be emitted due to breakdown or bypassing of equipment, as could occur with processes that cleanse combustion products. The potential market for solvent refined coal is difficult to predict largely because its use requires a long-term commitment on the part of producers to process it and on the part of the users, primarily the electric power utilities, to consume it. A level of production necessary for economy requires this. A processing cost of no more than 10 cents/MMBtu to convert bituminous coal to SRC should allow price-competitive access to over 60% of the current bituminous coal-fired combustion unit market. EXHAUST EMISSIONS FROM WILLIAMS RESEARCH CORPORATION GAS TURBINE ENGINES.
Interim rept. 18 Jun 69-18 Apr 70,
H. B. Moore, and J. A. Royer. 18 Jun 70, 92p* WR-ER8 APTD-0577
Contract PHS-CPA-22-69-84

Descriptors: (*Air pollution, *Exhaust gases), (*Gas turbines, Exhaust gases), (*Turbojet engines, Exhaust gases), (*Turbofan engines, Exhaust gases), Carbon monoxide, Nitrogen oxides, Hydrocarbons, Monitors, Combustion, Test methods.
Identifiers: *Air pollution detection, JP-4 fuel.

The exhaust emissions of several different models of gas turbine engines under development or in production were measured. The emissions measured were carbon dioxide, carbon monoxide, unburned hydrocarbons, and the oxides of nitrogen. The results are presented in a generalized form relating emissions to fuel air ratio and engine power or thrust. Techniques were developed to convey exhaust samples from engines in test cells to analysis equipment located elsewhere. Measurements were also made of the emissions from a gas turbine engine installed in a vehicle. Gas turbine engines are inherently low polluters in carbon monoxide and unburned hydrocarbons compared to other types of engines of the same power output. Transient engine operation produces many times the CO and hydrocarbon emission that steady state operation produces. Part load engine operation produces more CO and hydrocarbon emission than full load. The opposite is true of the oxides of nitrogen. The oxides of nitrogen are the most serious emission problem of gas turbine engines with respect to proposed emission controls. Satisfactory methods have been developed in this program for sampling exhaust pollutants from a variety of gas turbine engines. A heated sampling system is necessary to prevent deterioration of the unburned hydrocarbon sample between engine and analyzer. (Author)

SULFUR RECOVERY FROM FLUE GAS VIA REVERSIBLE DRY ABSORBENT.
Summary rept. 20 Jun 68-19 Jun 69.

1969, 82P* CCC-69-31 APTD-0578
Contract PH-22-68-40

Descriptors: (*Waste gases, *Adsorption), (*Air pollution, *Sulfur compounds), (*Wastes (Industrial), Recovery), (*Sulfates, Adsorption), Oxides, Oxidation, Fluidized bed processes, Catalysts, Sodium compounds, Vanadium compounds, Economics, Sulfuric acid.
Identifiers: *Sulfur trioxide, *Sulfur dioxide, *Waste gas recovery, *Sodium sulfates, Desorption, Vanadium pentoxide.

The feasibility was studied of a process for removal of sulfur oxides from flue gas using a reversible dry absorbent. Sulfur dioxide in the flue gas is first oxidized to SO3 and then absorbed on a fluidized solid. The sorbent consists of Na2SO4 impregnated on an inert carrier and takes up SO3 through the formation of sodium pyrosulfate. Oxidation of SO2 was not studied, however, catalytic oxidation was used to prepare an SO3 feed stream for the experimental program. An experimental program was carried out to develop kinetic and equilibrium data for the reaction of Na2SO4 supported on silica gel with SO3. The data were obtained under conditions suitable for a cyclic absorption and desorption process. Nitrogen oxides and water vapor in the concentration normally found in flue gas were found to have little effect on the SO3 absorption rate. Desorption of SO3 at a concentration of 6% in the gas was found to be very rapid at 930 F, and essentially quantitative recovery of SO3 was obtained at 1020 F. A process design was developed based on the reaction rates and temperature conditions determined in the experimental program. Economic studies pointed up the importance of using an inexpensive catalyst and sorbent and minimizing the loss of these materials. Therefore, the concept of using a combined catalyst and sorbent consisting of fly ash impregnated with V2O5 and Na2SO4 was developed. Preliminary experiments carried out using a fly ash based catalyst and fly ash sorbent were promising. The desorbed SO3 can be absorbed in sulfuric acid to produce concentrated H2SO4 or oleum for sale, or by maintaining a slightly reducing atmosphere in the desorber, a concentrated stream of SO2 (44%) can be produced. The estimated capital and operating costs show that the process is competitive with alternative processes. (Author)

AN EVALUATION OF COAL CLEANING PROCESSES AND TECHNIQUES FOR REMOVING PYRITIC SULFUR FROM FINE COAL.
Interim rept.

Sep 69, 279p* BCR-L-339
Contract PH-86-67-139
See also PB-193 484.

Descriptors: (*Coal, *Purification), (*Sulfur compounds, Coal), (*Pyrites, Coal), Air pollution, Organic compounds, Flotation (Separation), Particle size, Calcification.
Identifiers: *Coal (Low sulfur), *Benefication.

During the combustion of fossil fuels, sulfur oxide compounds are formed and released to the atmosphere. If it were feasible to physically remove pyrite from coal in significant quantities, the amount of sulfur oxide produced from coal firing could be reduced. The objective of the work was twofold; first, to extend the washability data to finer sizes of coal, and second, to evaluate coal cleaning methods and techniques for removing pyritic sulfur from the fine-sized coal. From previous work with pyrite removal from finely sized coal, two size consists were of interest in the washability studies: The 30 mesh x 0 size; and Each coal's 'as fired,' or p.c. grind. During evaluation of the pyrite liberation and removal characteristics of seventy different utility coals when pulverized to a topsize of 30 mesh and to the coal's p.c. grind, an extensive quantity of information has been generated. The results of the coal cleaning tests with the concentrating table were, in general, excellent. A wide range in sulfur reduction was obtained in the Majac air classification tests. (Author)

DELAWARE ESTUARY AND BAY WATER QUALITY SAMPLING AND MATHEMATICAL MODELING PROJECT.
Final progress rept. 1 Jul 67-31 Jan 69.

May 70, 114p FWQA-16090-DEL-5/70, W70-09526
Prepared in cooperation with Rutgers - The State Univ., New Brunswick, N.J.

Descriptors. (*Water pollution, *Estuaries), (*Delaware Bay, Water pollution), Mathematical models, Bays, Oxygen, Standards, Chlorides, Metals, Nitrates, Phosphates, Salinity, Sampling, Hardness.
Identifiers: Biochemical oxygen demand, Water quality.

The principal contents of the report are comparisons of water quality parameters for the Delaware Estuary with those previously estimated for years ending 1963. Data on water quality were also obtained for a number of major pollution sources. Comparisons show that previous mathematical models for the Delaware Estuary can still be used to verify dissolved oxygen levels. Current levels of dissolved oxygen fail to meet the standards established by the Commission. It is stated that in the future, regulation of carbonaceous raw waste of industry and municipalities will be sufficient to meet these standards, but no basis for this prediction is outlined in the report. The report provides background for further analysis of economically feasible alternatives programs on the Delaware River. (WRSIC abstract)

MICROWAVE OVEN TEST LOAD EVALUATION AND DETERMINATION OF INTERNAL MICROWAVE ENERGY DISTRIBUTION,
Harry Levine, and Robert L. Moore. Aug 70, 34p* BRH/DEP-70-23

Descriptors: (*Ovens, *Microwave equipme (*Leakage, Microwaves), Tests, Cobalt halides. Sponges (Materials).
Identifiers: *Microwave ovens, Cobalt chlorides, Microwave radiation leakage.

A study was made to investigate the variables that must be considered in any test procedure used to measure radiation leakage from microwave ovens. An evaluation was made of the effect of various factors involved in such measurements, including load temperature, size and shape of containers for the load, water load repeatability, and the suitability of loads other than water. A study was also made of the distribution of microwave patterns in an oven using sponge substrate impregnated with hydrated cobaltous chloride. The chemically impregnated sponge test could be a very helpful aid in determining the test load position in order to create the condition of worst possible leakage from a microwave oven. (Author)

BIOLOGICAL EFFECTS AND HEALTH IMPLICATIONS OF MICROWAVE RADIATION,
Stephen F. Cleary. Sep 69, 269p BRH/DBE-70-2
Proceedings of Symposium held at Richmond, Va., 17-19 Sep 69.

Descriptors: (*Radiation effects, *Microwaves), (*Health physics, Microwaves), (*Meetings, Microwaves), Central nervous system, Cataracts, Eye, Radiation hazards, Radio waves, Heat, Effectiveness.

Microwave generating devices have become increasingly prevalent and diverse in recent years. Their use is expected to continue to grow. Although there has been an awareness of the biological effects that can result from exposure to microwaves, there still exists a paucity of information and some controversy concerning the biological effects of these radiations. This Symposium was held to provide an indication of the present state of knowledge in the area of microwave health effects. The Proceedings are a compilation of the 31 technical papers presented, the deliberations that followed each one, and the two panel discussions that concluded the meeting. (Author)

RAPID-FLOW FILTER FOR SEWER OVERFLOWS.
Water pollution control research series.
Aug 69, 69p* FWPCE-DAST-25 W70-09741, FWQA-11023-DPI-08/69

Descriptors: (*Storm sewers, Overflows), (*Sewage filtration, Coal), Feasibility studies, Sanitary engineering, Solids, Cost effectiveness, Site surveys, Urban planning, Particle size, Ohio.
Identifiers: Filter beds, *Rapid flow filters, *Cleveland (Ohio).

In a pilot installation up to about 65% of solids from overflows of combined sewer systems were removed by using lump coal as a rapid-flow filter. The lump coal was sized to three-fourths by one and one-fourth inches, free of fines, and about eight inches in depth. The overflow is directed onto the filter bed in such a manner that the filter bed is not displaced. When plugged, or upon a routine basis, the filter bed is replaced; the spent bed, composed of coal and solids, is incinerated or landfilled or disposed of by whatever manner is locally in use which does not pollute the atmosphere or surface or underground waters. The potentially most valuable contribution in the work was the finding that conventional sewage sampling does not provide a representative indication of the nature of large solids content. A recommendation for an improved sampling procedure is made.

The report contains data for the chemical and meteorological parameters measured aloft during the 26 aircraft flights and for analyses performed on the Tedlar bag samples collected during vertical profiles. The data from the continuous instruments were recorded at ten second intervals during profiles and at one minute intervals at other times. Occasional spurious readings, usually caused by interfering signals, must be disregarded. The first four flights were made before all the instrumentation was operational and were used for check-out purposes. Asterisks are placed between the UV columns when the aircraft was in level flight. Other UV readings are not necessarily valid. Altitudes recorded by the transducer have been corrected for barometric pressure and instrument error by empirical equations, and most residual errors are less than 50 feet. (Author)

Descriptors: (*River basins, Models), (*Water use, Simulation), Computer programming, Water quality, Water pollution, Water treatment, Dams, Dissolved gases, Systems analysis, Biochemical oxygen demand, Salinity, Fluid flow, Water law, Temperature, Data processing systems, Ground water.

The development of a river basin simulation model comprising dissolved oxygen, temperature, specific electrical conductance, and basin hydrology submodels is demonstrated. The system model is the device for studying practical questions involving some measure of efficiency whether this be pollution minimization by treatment and flow regulation, maximizing water use with the quality constraint, maximizing economy efficiency, or in developing more comprehensive water laws. These questions can be ascertained by simulation of altered conditions, sensitivity analysis, or some optimization technique. Although the model in this report was developed for a specific prototype system, the Little Bear River in Utah, the approach, the methods and the conceptual framework can be transferable to other systems.

Identifiers: *Gas surface interactions, *Air pollution control, Matrix isolation techniques.

The aim of the reported research was to apply infrared spectroscopic methods to handle large numbers of process control samples and to obtain kinetic information to evaluate the effects of variables such as sulfur dioxide concentration on overall process efficiencies and to understand the deadburning phenomenon associated with limestone processes for removal of sulfur dioxide from flue gases. Major effort was directed toward development of rapid reliable methods for analysis of reacted limestones. A solvent system, suitable for dissolving limestone and capable of being

made infrared inactive by the dual cell technique was developed. The system--tetrasodium EDTA (ethylenediaminetetraacetic acid) saturated water was found to be the only one of a large number of systems investigated capable of dissolving limestone. The feasibility was studied of using a D2O based solvent system to determine the oxide and hydroxide contents of reacted limestones. The KBr pellet technique was studied in considerable detail. Ion exchange resin techniques were also studied in conjunction with the KBr method. Infrared spectroscopic techniques were also applied to studies of gas-solid interactions between the sulfur dioxide content of a simulated flue gas and various limestone absorbents and to an investigation of the deadburning phenomenon. The latter has revealed the strong possibility of chemical reactions with silicate impurities during high temperature calcination. Electron microprobe data has revealed that at lower calcination temperature, all of the silicates are present in discrete phases in the limestone. Studies were also performed to confirm the hydration of MgO in calcined, slaked dolomitic materials. (Author)

Descriptors: (*Air pollution, *Exhaust gases), (*Spark ignition engines, Air pollution), (*Motorcycles, Air pollution), Two stroke cycle engines, Carbon monoxide, Carbon dioxide, Hydrocarbons, Nitrogen oxide (NO), Nitrogen dioxide, Infrared spectroscopy, Ultraviolet spectroscopy, Gas chromatography.
Identifiers: *Air pollution detection.

Two-cycle spark ignited motorcycle engines are evaluated for exhaust emissions from the standpoint of both concentration (percent) and mass (gms/mile) according to current and projected Federal Testing Procedures for light duty vehicles (under 6,000 pound GVW). Seven two-cycle and one four-cycle motorcycle were tested for carbon monoxide, carbon dioxide, hydrocarbons, nitrogen oxide and dioxide using non-dispersive infrared, non-dispersive ultra-violet, flame ionization and gas chromatographic analytical techniques. The inconsistencies in the test method as applied to motorcycles are pointed out and suggestions are made for further studies. (Author)

LARGE POWER PLANT EFFLUENT STUDY (LAPPES). VOLUME 1. INSTRUMENTATION, PROCEDURES, AND DATA TABULATIONS (1968),
Francis A. Schiermeier, and Lawrence E. Niemeyer. Jun 70, 418p NAPCA-APTD-70-2

Descriptors: (*Air pollution, *Combustion products), (*Electric power plants, Air pollution), (*Climatology, Air pollution), (*Meteorological data, Air pollution), Tables (Data), Thermal power plants, Coal, Sulfur dioxide, Meteorological instruments, Airborne detectors, Plume detection, Meteorological balloons, Radiosondes, Topography, Atmospheric circulation, Pennsylvania.
Identifiers: *Air pollution detection.

The Large Power Plant Effluent Study (LAPPES) was initiated in Western Pennsylvania to evaluate the extent and effects of air pollution resulting from the largest complex of coal-burning generating stations in the United States. During 1968 four series of field experiments were conducted in an area surrounding the Keystone Generating Station; these experiments consisted of ground-based and air-borne plume measurements supported by extensive meteorological observations. Part 1 describes the topography and climatology of the generating station complex, the sulfur dioxide and meteorological monitoring equipment, and experiment operating procedures. Part 2 presents tabulations of plant operational parameters and air quality and meteorological data collected during 1968. Analyses of the data, evaluation of existing plume rise and dispersion theories, or development of new diffusion models are not presented here. (Author)

EVALUATION OF FABRIC FILTER AS CHEMICAL CONTACTOR FOR CONTROL OF SULFUR DIOXIDE FROM FLUE GAS.
Final rept. 20 Jun 68-31 Dec 69,
Han Liu, and Robert Chaffee. 31 Dec 69, 179p
Contract PH-22-68-51

Descriptors: (*Air pollution, *Sulfur dioxide), (*Air pollution control equipment, *Contractors), (*Adsorption, Sulfur dioxide), (*Bicarbonates, *Adsorbents), (*Dolomite (Rock), Adsorbents), Chemical engineering, Air filters, Fly ash, Sodium carbonates, Temperature, Combustion products, Nitrogen oxides.
Identifiers: *Air pollution control.

The sorption of SO2 by sodium bicarbonate, nahcolite, hydrated dolomitic lime, promoted hydrated dolomitic lime, and hydrated lime was studied using a full scale pilot fabric filterhouse as the chemical contactor under various operating conditions. A total of 62 tests was performed to determine the effects of sorbent stoichiometric ratio, operating temperature, flue gas flow rate (filter ratio), mode of house operation, method of sorbent feeding and sorbent retention time. For the experiments conducted, gas temperatures ranged between 270F and 640F; flow rates between 7,500 ACFM and 15,000 ACFM; sorbent to SO2 stoichiometric ratios from 0.75 to 3.4 and sorbent retention time from 2.5 seconds to 6 seconds. Tests were also conducted to determine how much of the SO2 removal was taking place while the sorbent was in suspension and how much was taking place in the filtercake on the bags. Measurements of NO2 were also made during the tests. It was definitely shown that the fabric filter can perform adequately as an effective chemical contactor for removal of SO2 from the flue gas as well as a control device for flyash. Of the various filterhouse operating parameters tested, the operating temperature and the stoichiometric ratio have the strongest effect on SO2 conversion efficiency. (Author)

Descriptors: (*Activated sludge process, *Aeration), (*Sewage treatment, Activated sludge process), Oxygen, Biochemical oxygen demand, Oxygenation, Cost estimates, Plant layout, Air, Biomass, Maintenance, Sludge disposal, Aerators.
Identifiers: *Waste water treatment.

A full scale system designed to demonstrate the practical and economical use of high purity oxygen gas in aeration of the conventional activated sludge waste treatment process was tested under a variety of operating conditions in a direct performance comparison with a parallel air aerated system. A sparged-turbine, gas-liquid contacting unit was employed in covered tanks of conventional design with liquid and gas staging for cocurrent flow of each phase. This oxygenation system required very low power input for oxygen transfer and liquid mixing. The oxygenation system could operate with MLVSS concentrations of as high as 4500 mg/liter achieving about 90% BOD removals at aeration detention times as low as 1.2 hours (raw flow + recycle flow) treating domestic waste of 220 mg/liter BOD. Biomass from the oxygenation system is highly flocculent and readily settleable with desirable handling characteristics. Recycle and waste activated sludge suspended solids concentrations of about 3% were achieved. Process advantages recognized with the oxygenation system indicate significant reductions in secondary waste treatment costs in comparison to conventional diffused air aerated systems. IN-PLANT SURVEY OF TELEVISION RECEIVERS FOR X-RADIATION EMISSION CAPABILITY.
Rept. for Jun-Sep 69,
D. R. Smith, S. E. Reiter, and T. M. Smith. Sep 70, 76p* BRH/DEP-70-24

Descriptors: (*Television receivers, *Radiation hazards), X rays, Radiation measuring instruments, Permissible dosage, Safety engineering, Color television.
Identifiers: In plant surveys.

Visits were made to the facilities of 21 domestic television manufacturers and one retailer of foreign receivers to measure x-radiation emissions from television receivers considered typical of those being marketed since the effective date of the Radiation Control for Health and Safety Act of 1968. The test data obtained during these visits provided basic information on the capability of the receivers to emit x-radiation under certain operating conditions, including various adjustments to the receivers that could result in x-radiation emission under conditions expected to be found during home use. The information was used in the development of the performance standard for television receivers and also in the development of recommendations for future programs of compliance testing under the performance standard. NATIONAL SURVEY OF THE ODOR PROBLEM. PHASE I OF A STUDY OF THE SOCIAL AND ECONOMIC IMPACT OF ODORS.
Jan 70, 258p* APTD-0580-1
Contract PHS-CPA-22-69-50
See also Appendix, PB-194 377.

Descriptors: (*Odors, *Public opinion), (*Air pollution, Odors), Surveys, Industrial wastes, Urban areas, Government policies, Atmospheric motion, Wind (Meteorology), Tanning materials, Refineries, Exhaust gases, Chemical industry, Sewage treatment, Tall oil, Public health, Petroleum industry.

The intent was the generation of information relative to the basic definition, identification, and assessment of the national odor problem. Three factors - odor producing potential of industrial odorant sources, atmospheric vulnerability, and size of population - were developed separately and then combined for an indication of the odor problem potential of each three digit postal zip code area in the nation. Local air pollution control agencies were surveyed to identify areas where they believe that significant odor problems exist. Within the principal cities of each of seven representative metropolitan areas, two-day technical field investigations and public opinion surveys were conducted. Sensory evaluations of odor were also performed in Philadelphia, Pennsylvania. Odor problem potential exists in most metropolitan areas in the United States. But,

primarily because of meteorological factors, the probability of encountering odor problems is greatest in the Appalachian and California Coastal metropolitan areas. A large number of residents - perhaps as many as 25 million - perceive odors as problems and desire some form of abatement. The results of the mail survey and personal interviews of local air pollution control agencies indicated that when concentrations of air pollutants can be related to amounts of property damage and/or ill health, abatement criteria (e.g., minimum levels of emissions) can be established and enforced. However, in cases of air pollutants causing only odors, such relationships are generally non-existent. Consequently, odor abatement criteria, if any, are typically based on number of complaints and inadequately backed by nuisance laws. (Author)

The concepts embodied in the development and implementation of a comprehensive R and D and program planning capability for EHS were examined. Environmental stressors were selected as the basis for planning rather than categorical approaches. For the mix of complex problems encountered by EHS, a system to establish priorities is required. The integrated planning system which was recommended utilizes mathematical models to assess the impacts of technology upon man and his environment and the assignment of priorities based upon quality of life indices. Specific elements of the management-assistance system which was defined include an overview environmental health planning function to provide coordinated and comprehensive planning in the man-centered ecosystem context; an impact assessment capability based upon a hierarchy of mathematical models; a threat identification function to identify and evaluate potential threats to man and the environment through intensification or extension of current use patterns of products and services or through introduction of new stressors; and an environmental health information network to provide a well-organized information base. A hierarchical approach to the development of mathematical models for prediction of the impacts of stressors upon man and the environment was described and specific examples are presented for lead in the environment. The study for the Environmental Health Service is an investigation of the problems being faced in protecting man's environment from threats created by man. This study included the following major efforts: (1) research and development planning in the perspective of man in his total environment, (2) information network analysis, and (3) model case studies. This volume of the report concerns itself with Information Network Analysis. An investigation was made of the existing EHS information resources including the monitoring and surveillance activities. A survey was conducted of the documentation systems and libraries in order to determine their operational characteristics as related to an information network. (Author)

Identifiers: *Environmental health.

The lead model case study was undertaken to serve as a working example and to evaluate the technical, intelligence, and project information system under consideration for EHS. Occurrence and use patterns for lead within the U.S. were examined. The major categories of uses in decreasing order were production of storage batteries and accessories, gasoline antiknock additives, pigments, ammunition, solder, cable covering, and caulking lead. Leaded fuels are the major source of environmental lead. Pediatric plumbism, the most significant acute health problem, arises from lead used as a pigment. The economic aspects of this problem area were investigated. While lead is very slowly absorbed from environmental sources, its gradual accumulation in the body is the basis for progressive toxicity. Additional research is required to determine the chronic effects of lead in the environment on health, and better diagnostic and therapeutic techniques are needed in support of this research. A mathematical model was developed to represent the environmental transport of the stressor lead from several sources with the subsequent intake of lead by man. This model can be used to assess the impact of contemplated actions on lead body burdens, to define R and D requirements, and to identify the needs and locations for monitoring and surveillance. A categorized bibliography for lead is included. (Author)

Identifiers: *Environmental health.

DDT was selected as the compound for this study due to paucity of data regarding environmental effects of other classes of pesticides. Human exposure to pesticides was examined from two major pathways; the direct pathway which deals with direct uptake from primary sources of pesticide release, and the indirect pathway which involves human exposure by translocation through air, water, or food. Reductions in accidential poisonings could be made by limiting the total toxicant contents of home packages of pesticides, and means to reduce deaths from aerial applications warrant further study of this method of application. The control of human burden of pesticides by control of food residues is only partially effective since evidence on pesticide distribution in the environment suggests that about half of the intake is from inhalation of insecticide aerosols or dust laden with insecticides. There is presently no evidence that pesticide exposure directly shortens human life. Fish and birds are more sensitive to pesticides in the environment. Fish lack the basic microsomal oxidase enzyme systems which detoxify pesticides and birds appear to be very sensitive to the sterodal hormone mimicking effects of the chlorinated hydrocarbons. Descriptors: (*Radiation hazards, *Ultraviolet radiation), Tissues (Biology), Radiation effects, Damage, Whole body irradiation, Standards, Radiation dosage, Public health, Radiation tolerance, Cells (Biology), Malignant neoplasms.

Ultraviolet radiation is produced by arcs and incandescent sources operating at high temperatures. The envelope of closed sources may filter out most of the ultraviolet radiation produced. Of the transmitted ultraviolet, two portions of the spectrum are of public health interest. Wavelengths between 1900 and 3000 angstroms (far ultraviolet) are mutagenic, and may be lethal to cells. Wavelengths above about 3000 angstroms (near ultraviolet) appear not to be mutagenic, and are lethal at doses which are very high in comparison with lethal doses in the 1900-3000 angstroms range. However, skin cancer may result from repeated near ultraviolet exposure. Penetration of ultraviolet beyond the skin of mammals is negligible. Wavelengths below about 1900 angstroms (vacuum ultraviolet) are absorbed by air and water, so exposure of biological tissue must be performed in vacuo. (Author)

Identifiers: *Automobile exhausts, *Air pollution control.

A study was conducted to investigate the feasibility of using methanol as a substitute fuel for gasoline to reduce exhaust pollutants emitted from automotive engines. Work was performed in two phases encompassing both automotive and single cylinder laboratory engine tests. It was concluded that methanol displays significant potential as a pollution control substitute fuel for gasoline. In the automotive tests conducted with a slightly modified, non-optimized engine system, methanol was shown to be a satisfactory fuel from the standpoint of engine operation and to produce methanol emissions as low as 1900 PPM (317 PPM-hexane equivalent). Vehicle mileage was low (7 to 9 mpg) as expected. Suspected high aldehyde emissions were confirmed. It is believed that optimization of the fuel-air ratio, the mixture distribution to the cylinders, and heating of the fuel or fuel-air mixture, will result in improved performance and substantially reduced emissions of all pollutants, except NOx. Laboratory engine operation with blends of reform gases (CO + 2H2) and methanol was shown to be successful in improving engine performance (subject to engine knock limitations) and providing major reductions in methanol and formaldehyde emissions. If the reforming technique can be economically implemented in an automotive system, it is highly probable that emission levels can be achieved which are well below those possible with gasoline. FEASIBILITY OF HYDROLYSIS OF SLUDGE USING LOW PRESSURE STEAM WITH SO2 AS A HYDROLYTIC ADJUNCT AND UTILIZATION OF THE RESULTING HYDROLYSATE.
Water pollusion control research series.

Dec 69, 38p* FWPCA-17070-EKN-12/69 W71-00164
Prepared in cooperation with Snell (Foster D.), Inc., Florham Park, N.J., Contract DI-14-12-188.

Descriptors: (*Sewage treatment, Sludge disposal), (*Activated sludge process, Hydrolysis), (*Sludge disposal, *Hydrolysis), (*Feeding stuffs, Sludge), Sulfurous acid, Proteins, Filtration, Waste disposal, Reduction (Chemistry), Sulfur dioxide, Concentrating, Molasses, Cost estimates.

Sulfurous acid, when used with hydrolysis in the treatment of activated sludge, will increase soluble solids, improve filtration efficiencies and reduce moisture content of the resultant filter cake. Use of a 0.5% sulfurous acid and hydrolytic treatment of sludge at 140 degrees C for one hour increased the soluble solids content of the activated sludge by 20%. Concentration of the solubilized extract produced a syrup; 85% of the solids content of the syrup was organic. By TKN estimates, over 20% of these solids were proteinaceous. An amino acid analysis indicated it could be of value as an animal feed, and this was confirmed in rat feeding studies (at a 10% level in the diets) showing an efficiency of food utilization of 42 for the organic molasses as compared to 39 for cane molasses. National Air Pollution Control Administration, Arlington, Va. Div. of Air Quality and Emission Data.
CONTINUOUS AIR MONITORING PROJECTS: 1967 DATA TABULATIONS AND SUMMARIES, DENVER.
Apr 69, 110p APTD-69-8

Descriptors: (*Air pollution, *Urban areas), Colorado, Monitors, Continuous sampling, Diurnal variations, Seasonal variations, Carbon monoxide, Nitrogen oxide (NO), Nitrogen dioxide, Sulfur dioxide, Oxidizers, Aerosols, Arithmetic means, Tables (Data).
Identifiers: *Air pollution detection, *Denver (Colorado), Continuous air monitoring projects, Soiling index.

Hourly average concentrations of six gaseous pollutants (carbon monoxide, nitric oxide, nitrogen dioxide, sulfur dioxide, total hydrocarbons, and total oxidants), and 2-hour measurements of soiling index levels are tabulated for Denver. A brief summary of monthly means and maximums and graphs of seasonal diurnal patterns of gaseous pollutants are included. Annual frequency distributions of the data pertaining to gases and soiling index are presented for Denver, and for Chicago, Cincinnati, Philadelphia, St. Louis, and Washington, D. C. (Author)

TALL STACKS, VARIOUS ATMOSPHERIC PHENOMENA, AND RELATED ASPECTS.

May 69, 100p APTD-69-12
Revision of report dated 1 Aug 68.

Descriptors: (*Air pollution, *Atmospheric motion), (*Sulfur dioxide, Air pollution), (*Bibliographies, Air pollution), (*Flue gases, Atmospheric motion), Combustion products, Atmospheric diffusion, Industrial wastes, Plumes, Chimneys, Incinerators, Electric power plants, Smoke, Topography, Meteorological data, Dispersions.

Dispersion from tall stacks is discussed. Then a bibliography of 214 abstracts of documents currently in the information retrieval system of the Air Pollution Technical Information Center is presented. The abstracts are arranged in three major sections: Tall Stacks; Atmospheric Phenomena; and Miscellaneous. Within each section, they are alphabetized by author. Most date from the late'60's, however the earliest is dated 1949. (Author)

AIR POLLUTION CONTROL ACTIVE RESEARCH GRANTS FOR FISCAL YEAR 1969.
Oct 69, 43p APTD-69-21

Descriptors: (*Air pollution, *Research projects), Grants, Expenses, Public health, Respiratory diseases, Atmospheric corrosion, Chemical analysis, Exhaust gases, Paper industry.
Identifiers: *Air pollution control, Plant damage.

Research grants were awarded in eight major areas: human health effects, agricultural effects, socio-economic and political studies, analyses and physico-chemical investigations, development of analytic methods and equipment, meteorology, air pollution source control, and communications. A table summarizes the quantity and amount of the grants in each categorical area. A second table shows the distribution of the quantity, amount, and percent of total funds by subject area within each category. In the main listing, for each subject area within each category, the following are listed: each grant number; the grantee's name, institution, and project title; project period; and monetary support. A numerical index of grant numbers refers the reader to the category where they are listed. (Author)

PROSPECTS FOR ELECTRIC VEHICLES. A STUDY OF LOW-POLLUTION-POTENTIAL VEHICLES - ELECTRIC.

Oct 69, 105p APTD-69-52
Contract PH-86-67-108

Descriptors: (*Electric vehicles, Forecasting), (*Air pollution, *Transportation), (*Electric automobiles, Forecasting), (*Electric batteries, Electric vehicles), (*Highway transportation, Electric vehicles), Electric trucks, Buses (Vehicles), Alkali metals, Storage batteries, Electric controllers, Molten salt electrolytes, Thermal insulation, Electric motors, Fuel cells, Cost estimates, Refueling, Hybrid propulsion, Weight (Mass), Metal air batteries, Lead acid batteries, Battery chargers, Research projects, Automobile bodies, Aerodynamic drag.
Identifiers: *Air pollution control.

The major purpose of the research described was to assess the state of the art in the technologies on which the future development of electric highway vehicles depends. The assessment is made on the basis that there will be no major change in the patterns of urban transportation and focuses upon the technical requirements of the vehicle. As a framework for the study, technical and, to a lesser extent, cost criteria were established for six classes of electric vehicles, most of which correspond closely in performance to existing conventionally powered types. On the basis of these criteria the prospects for vehicle application of various electric motor and control systems and a wide range of electrical power sources including batteries, fuel cells, and engine-generator-battery hybrids are compared. The most promising systems for further development are identified and the magnitude of the shortfall in their present characteristics is estimated. Recommendations are made for the expansion of future effort in these areas, taking into account the expected contributions from existing programs in the public and private sectors of the economy. The technology of electric vehicles appears to be attainable, quite possibly at an acceptable cost. A very substantial technical effort is called for if the required technologies are to be brought to maturity. The technical risks of this endeavor are too great for the investment to be borne by private capital alone, particularly since the major objective is a technology desirable for its social good rather than for its profit potential. AIR POLLUTANT EMISSIONS RELATED TO LAND AREA - A BASIS FOR A PREVENTIVE AIR POLLUTION CONTROL PROGRAM,
J. D. Williams, J. R. Farmer, R. B. Stephenson, G. G. Evans, and R. B. Dalton. Jul 68, 19p APTD-68-11

Descriptors: (*Air pollution, *Urban areas), (*Land use zoning, Air pollution), Regional planning, Atmospheric motion, Sulfur dioxide, Combustion products, Industrial wastes, Standards, Exhaust gases, Atmospheric diffusion, Electric power plants.
Identifiers: *Air pollution control.

Advances in technology have made it possible to establish zoning performance standards, which will prevent air-use - land-use conflicts. In the past, such standards were based on source capability and were uniformly inadequate. Now, because of the ability to predict air pollution levels, standards that accomplish both preventive and control aims can be applied. Land area, as used for urban planning purposes, reflects the diffusion capability and greater knowledge concerning the diffusion of pollutants in the air, prediction systems are within practical application range. An example of the output information from such a diffusion model is discussed. (Author)

KANAWHA VALLEY AIR POLLUTION STUDY.

Mar 70, 371p APTD-70-1
Prepared in cooperation with West Virginia Air Pollution Control Commission. Errata sheet inserted.

Descriptors: (*Air pollution, *Regional planning), (*West Virginia, Air pollution), Environmental surveys, Valleys, Meteorological data, Odors, Plants (Botany), Atmospheric corrosion, Economics, Particles, Combustion products, Exhaust gases, Industrial wastes, Electric power plants, Monitors, Incinerators, Atmospheric circulation.
Identifiers: Kanawha Valley, Kanawha County (West Virginia), Air pollution detection, Plant damage, Air pollution control equipment.

The aim was to collect and assemble data and information as a basis for technical and official action needed to attain and conserve a desirable air quality in Kanawha Valley, West Virginia. The joint study was conducted from August 1964 through December 1966 and included: (1) measurement of air quality; (2) measurement and description of meteorological parameters; (3) odor studies; (4) collection and evaluation of existing information; (5) pollutant emission inventory; (6) study of materials deterioration; (7) study of means and economics of pollution control; and (8) special studies on vegetation, health, public attitudes, and pollutants not routinely measured. The results of the first seven activities are included. Preliminary results of the studies in vegetation, health and attitudes were considered in developing the Air Resource Management Program. FEASIBILITY OF A STABILIZATION-RETENTION BASIN IN LAKE ERIE AT CLEVELAND, OHIO.

May 68, 194p W71-00411, FWQA-11020-05/68
Contract DI-14-12-27

Descriptors: (*Waste water, Settling basins), (*Settling basins, Great Lakes), Water treatment, Biochemical oxygen demand, Sedimentation, Stabilization, Cost estimates, Water quality, Abatement, Feasibility, Ohio.
Identifiers: *Cleveland (Ohio), *Lake Erie.

A feasibility study was conducted of a large stabilization-retention basin to be constructed in Lake Erie at Cleveland, Ohio. The stabilization is viewed as a possible alternative to separation of a combined sewer system. The proposed basin would treat flows from a number of large combined sewer overflows, from several polluted streams, and effluent from a large secondary wastewater treatment plant. Treatment would consist of bio-oxidation, sedimentation, stabilization and disinfection. The chemical, biological, physical and structural aspects of the proposed basin were studied, and the probable benefits to water quality and the effectiveness of the basin as a treatment device were evaluated. Estimates of cost of the basin and collection system were prepared, and it was concluded that the stabilization basin would provide a higher degree of pollution abatement than would separation of sanitary and storm sewers, at about one-third the cost. Report on Pre-Conference Investigations.

Descriptors: (*Air pollution, *Urban areas), Abatement, History, Topography, Climatology, Particles, Sulfur dioxide, Hydrogen sulfide, Nitrogen oxides, Exhaust gases, Combustion products, Industrial wastes, Metal, industry, Chemical industry, Portand cements, Dust, Refuse disposal, Atmospheric motion, Temperature inversions, Ohio, Kentucky, West Virginia.
Identifiers: *Ironton (Ohio), *Ashland (Kentucky), *Huntington (West Virginia), Soiling index, Open burning.

An extensive area survey of air pollution was conducted in the Ironton, Ohio; Ashland, Kentucky; Huntington, West Virginia region for the period of September 1965 to August 1967. The following topics are discussed: topography; climate; materials deterioration; industrial, municipal, and private emission sources; geographic distribution of pollutants; and measurement methods and locations. The pollutants of interest were particulates, NOx, SOx, and H2S. An emission inventory is included, along with discussions of some of the major pollution sources. (Author)

EFFECTS OF GASOLINE ADDITIVES ON CARBURETOR AND PCV SYSTEM PERFORMANCE AS THEY RELATE TO EXHAUST EMISSIONS.
First year rept.

30 Apr 70, 89p APTD-0591

Descriptors: (*Air pollution, *Exhaust gases), (*Fuel additives, Air pollution), Field tests, Gasoline engines, Carburetors, Automobiles, Manufacturers, Spark ignition engines.
Identifiers: *Positive crankcase ventilation, Automobile exhausts, PCV (Positive Crankcase Ventilation).

Three groups of 16 cars each or a total of 48 fleet vehicles will be driven in normal urban and suburban modes of operation over a 24,000 mile interval under controlled fuel conditions and maintenance. Each group of 16 cars is being operated on the same base fuel. Two of the three group's test fuels contain a gasoline additive which is added to the base fuel. Exhaust emission measurements were made as the vehicles started the test and at each subsequent 4,000 mile interval. An analysis of variance was conducted on each of the 19 emission parameters for the zero and 4,000 mile interval. A major conclusion reached on the basis of these analyses is that: no significant differences in emission parameters were determined at the 4,000 mile point on the basis of fuel employed. A secondary conclusion drawn concerns the make factor. That conclusion is: all emissions parameters vary significantly between makes; however, no single make is consistently the highest or lowest valued across the spectrum of the 19 emissions parameters measured. The VW vehicles were distinctly different to such a degree that their data were not included in the final analysis. (Author)

Grady T. Helms, James H. Southerland, Kenneth R. Woodard, Ibrahim J. Hindawi, and Dale H. Coventry. Oct 70, 122p APTD-0583

Descriptors: (*Air pollution, *Urban areas), (*Munitions industry, Air pollution), Army, Tennessee, Georgia, Particles, Nitrogen dioxide, Nitrogen oxide, Sulfur dioxide, Carbon monoxide, Atmospheric corrosion, Hydrocarbons, Exhaust gases, Combustion products, Sulfates, Ammonium compounds, Climatology, Refuse disposal, Vegetation, Nitric acid, Sulfuric acid, Industrial wastes, Nitrates.
Identifiers: *Chattanooga (Tennessee), *Rossville (Georgia), *Plant damage, Soiling index.

In 1965, the U.S. Army reactivated the Volunteer Army Ammunition Plant at nearby Tyner, Tennessee, to produce explosives needed for defense. Shortly thereafter numerous complaints of particulate and gaseous emissions were received by various governmental officials from many irate citizens in the surrounding area. On October 1, 1967, an air quality survey was begun in the Chattanooga, Tennessee - Rossville, Georgia, interstate area to fulfill both the request of the Department of Defense and the City of Chattanooga. Four other investigations were conducted in the area during the period from October 1967 through April 1969: (1) meteorological measurements; (2) vegetation effects measurements; (3) materials effects studies; and (4) emissions survey. This report concerns these investigations and their results. (Author)

MOTOR VEHICLE EXHAUST EMISSIONS - GARY, INDIANA,
C. R. Rehmann. 1968, 27p APTD-68-5

Descriptors: (*Air pollution, *Exhaust gases), (*Urban areas, Air pollution), Carbon monoxide, Hydrocarbons, Nitrogen oxides, Sulfur oxides, Crankcase fumes, Evaporation, Indiana.
Identifiers: *Gary (Indiana), Automobile exhausts.

The results of the motor-vehicle exhaust emission inventory are reported by a grid system on a map of the study area and by grids. The total amounts of pollutants (CO, HC, NOx, SOx, and particulates) emitted from motor vehicle exhausts are tabulated. Evaporative losses and crankcase emissions in the study area account for 47 percent of the total hydrocarbon emissions, and exhaust emissions compose the remaining 53 percent. Typical analysis of motor vehicle emissions was used to check these estimates. Three pollutants - carbon monoxide, hydrocarbons, and nitrogen oxides - comprise 99 percent of the total weight of exhaust emissions in the study area. Sulfur oxides and particulates generally compose the greater percentage of the pollution in an industrial-urbanized area; however, these pollutants comprise only a small portion of the total weight of exhaust emissions. These pollutants are significant because of their toxicity, particle size, and secondary reactions involving the formation of aerosols. The combined emission rate of sulfur oxides and particulates is 2,640 pounds per day. If this pollution were distributed over the 41.6 square miles that comprise the land area of the City of Gary, the emission density for these two pollutants would be 63.5 pounds per square mile as compared to the emission density for carbon monoxide of 845.9 pounds per square mile. The vehicle-mile average-speed approach is presently the most accurate method for estimating the emissions from motor vehicle exhausts. The total emission of sulfur oxides and particulates from motor vehicles is small as compared with the three major pollutants. The use of the emission factors based on the fixed-mode cycle does not, therefore, introduce much error in the total weight of pollutants. (Author)

THE BENEFICIAL USE OF STORM WATER. A SYSTEM STUDY, DESIGN, AND EVALUATION OF THE LOCAL STORAGE, TREATMENT, AND REUSE OF STORM WATER.
Final rept.

Aug 68, 378p HIT-344 W71-00409, FWQA-11030-DNK-08/68
Contract DI-14-12-20

Descriptors: (*Water supplies, *Maryland), (*Surface water runoff, Water supplies), (*Water treatment, Surface water runoff), Storm sewers, Water consumption, Water treatment devices, Mathematical analysis, Water quality.
Identifiers: *Columbia (Maryland), *Water treatment plants.

The report covers the work performed on the collection, storage, treatment, and reuse of storm water as a means of pollution control and water supply augmentation. A discussion is presented of the work performed in the analysis and optimization of the system; the conceptual designs of potable, sub-potable, and pollution control systems; the conceptual design of a system for controlling pollution using a 'conventional design' approach, the results of the system evaluation and plans for the demonstration of the local storage, treatment, and reuse of storm water. The appendices to this report include the derivations of the hydrology equations, survey reports on water usage and the public acceptance and legal aspects of reuse, design reports on the 'conventional' and demonstration system, detailed estimates on the cost of the demonstration program, and descriptive information on packaged water treatment plants. Descriptors: (*Water pollution, *Oils), (*Metal industry, Water pollution), (*Industrial wastes, Water pollution), Lubricating oils, Iron and steel industry, Cold rolling, Coagulation, Polyelectrolytes, Flocculating, Flotating, Emulsification, Zeta potential, pH.
Identifiers: *Waste water treatment, *Water pollution control, *Oil pollution.

Cold reduction of steel strip results in the production of large quantities of waste water containing variable amounts of oil. A five stand tandem cold mill located at Armco Steel Corporation's Ashland, Kentucky Works produces 200 to 500 gpm of waste water containing 400 to 4,000 ppm of oil. The COD of the waste varies from 400 to 20,000 ppm. A treatment process and facility was developed, constructed, and demonstrated, on full scale, for the treatment of cold mill wastes. The treatment process utilized chemical coagulation to break the emulsions. The chemicals employed included alum, lime, clay and organic polyelectrolyte. The process consisted of the following treatment steps; equalization, chemical addition and rapid mixing, flocculation, and dissolved air flotation. Zeta potential, streaming current, and particle size distribution were used in laboratory studies to describe the effect of the following variables on process kinetics; acid number, initial oil concentration, type of emulsifier, chemical dosage, order of chemical addition, reaction time, and final pH. Based on these studies, an hypothesis of the emulsion breaking mechanism was proposed. Oil, COD, and turbidity were used in field studies to establish the effect of the following variables on treatment efficiency; chemical concentration, order of chemical addition, chemical mixing time, flocculation mixing time and speed, and air flotation time and recirculation rate. Based on these studies, design criteria and operating costs for this process were presented. (Author)

Identifiers: *Sandusky River, *Bucyrus (Ohio), *Water pollution control.

The report contains the results of a detailed engineering investigation and comprehensive technical study to evaluate the pollutional effects from combined sewer overflows on the Sandusky River at Bucyrus, Ohio and to evaluate the benefits, economics and feasibility of alternate plans for pollution abatement from the combined sewer overflows. The City of Bucyrus is located near the upper end of the Sandusky River Basin which is tributary to Lake Erie. Bucyrus has an incorporated area of about 2,340 acres, a population of 13,000, and a combined sewer system with an average dry weather wastewater flow of 2.2 million gallons per day. A year long detailed sampling and laboratory analysis program was conducted on the combined sewer overflows in which the overflows were measured and sampled at 3 locations comprising 64% of the City's sewered area and the river flow was measured and sampled above and below Bucyrus. ROTARY VIBRATORY FINE SCREENING OF COMBINED SEWER OVERFLOWS.
Water pollution control research series.

Mar 70, 82p FWQA-DAST-5 W71-00476, FWQA-11023-FDD-03/70

Descriptors: (*Storm sewers, *Strainers), Performance, Rotation, Solids, Removal, Pipes, Sewage treatment, Cost effectiveness, Surface water runoff, Combined sewers, Design, Feasibility.
Identifiers: *Rotary screens.

The objective of this study was to determine the feasibility, effectiveness, and economics of employing high-rate, fine-mesh screening for primary treatment of storm water overflow from combined sewer systems. The final form of the screening unit stands 63 inches high and has an outside diameter of 80 inches. The unit is fed by an 8-inch pipe carrying 1700 gpm (122 gal/min/sq ft) which is distributed to a 60-inch diameter rotating (60 rpm) stainless steel collar screen having 14 square feet of available screen area and a 165 mesh (105 micron opening, 47.1 percent open area). The screen is backwashed at the rate of 0.235 gallons of backwash water per 1000 gallons of applied sewage. Based on final performance tests run on dry-weather sewage, the unit is capable of 99 percent removal of floatable and settleable solids, 34 percent removal of total suspended solids and 27 percent removal of COD. The screened effluent is typically 92 percent of the influent flow. On the basis of a scale-up design of a 25 mgd screening facility, the estimated cost of treatment is 22 cents/1000 gallons.

PROPOSED COMBINED SEWER CONTROL BY ELECTRODE POTENTIAL,
Water pollution control research series.

Feb 70, 79p W71-00479, FWQA-11024-DOK-02/70

Descriptors: (*Water pollution, *Sewage), (*Flow control, *Electrodes), (*Storm sewers, Flow control), (*Combined sewers, Flow control), Overflow, Water analysis, Biochemical oxygen demand, Phosphorus, Nitrates, Chlorides.
Identifiers: *Water pollution control.

The effectiveness was investigated of electrode potential measurements to modulate discharges from combined and storm sewer overflows to reduce stream and estuarine pollution. Studies included varying the composition of sewage, flow rate and examining the tendency to polarize or coat the electrodes under actual flow conditions. The analysis of experimental results shows a high degree of correlation between the electrode potential of the sewage and its strength. Linear correlation coefficients between electrode potential were determined for BOD, COD, SULFIDES, TOTAL PHOSPHORUS, NITRATES, AND CHLORIDES. It was demonstrated that the potential will be more negative the greater the S (-2) concentration, except when a small amount of DO is present which exerts an attenuating influence. Flows carrying substantial concentrations of reducing substances with a detrimental impact on the dissolved oxygen reservoir of any receiving waters must be kept from exerting their damaging influence on bathing beaches, tidal estuaries and other water resources. Controlling the flow from outfalls by the electrode potential should significantly help to minimize such insults to the environment. (Author)

LEGAL ASPECTS OF WATER STORAGE FOR FLOW AUGMENTATION,
William R. Walker, and William E. Cox. Aug 70, 231p W71-00480, FWQA-1609-OFPW-03170
Grant FWPCA-WP-01087

Descriptors: (*Water storage, *Water law), Reservoirs, Water quality, Water flow, Law (Jurisprudence).

Enabling legislation for storage of water in Federal reservoirs for supply purposes and quality control through low-flow augmentation includes the Water Supply Act of 1958, the Watershed Protection and Flood Prevention Act, and the 1961 Amendment to the Federal Water Pollution Control Act. The Flood Control Act of 1944 and the Federal Water Power Act also have possible applicability. The enabling legislation and other law defining the operating procedure of the federal water resource agencies make water supply and water quality storage somewhat dependent on the provisions of state water law. State law may affect the acquisition of water rights for storage and the procedure whereby it is applied to its intended functions. The impact of state law on the acquisition process varies according to whether water rights are acquired by the United States or by a private party. When private interests are responsible, as in the case of

water supply storage in Corps of Engineers and Soil Conservation facilities, the aquisition of rights is not as complex as when a Soverign is involved. Aquisition of water rights by the federal government gives rise to federal-state jurisdictional problems and several unresolved questions concerning water rights. (WRSIC abstract).

AIR POLLUTANT EMISSION INVENTORY OF NORTHWEST INDIANA; A PRELIMINARY SURVEY 1966,
Guntis Ozolins, and C. Rehmann. Apr 68, 43p
APTD-68-4

Descriptors: (*Air pollution, *Urban areas), (*Metal industry, Air pollution), (*Refineries, Air pollution), Indiana, Combustion products, Industrial wastes, Exhaust gases, Refuse disposal, Particles, Hydrocarbons, Sulfur dioxide, Chemical industry, Iron and steel industry, Petroleum industry, Carbon dioxide, Nitrogen oxides, Electric power plants, Coal.
Identifiers: *East Chicago (Indiana), *Gary (Indiana), *Whiting (Indiana), *Hammond (Indiana), Open burning.

Sources of air pollutant emissions were surveyed to quantify the total pollution load emitted to the air over the Northwest Indiana communities of East Chicago, Gary, Hammond, and Whiting. The emissions are reported on an annual basis and subdivided into five major pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. The four major source categories that were utilized in reporting emissions from area and point sources are: fuel combustion in stationary sources, fuel combustion in mobile sources, combustion of refuse, and industrial process losses. The results of this survey are reported by city and illustrated on the grid system established by the Northwest Indiana Air Resource Management Program. (Author)

Descriptors: (*Ecology, *Streams), (*Carbon, *Food chains), (*Phosphorus inorganic compounds, Food chains), Stream pollution, Water pollution, Algae, Fresh water biology, Nitrogen, Metabolism, Water chemistry, Water pollution, Bacteria, Aquatic biology.

Laboratory and field investigations were conducted on the fate and cycling of carbon and phosphorus in selected aquatic ecosystems. Inorganic carbon, as CO2, supplied by both bacterial cultures and cylinder gases, stimulated the growth of the blue-green alga Anacystis nidulans. Diel studies of a stream which received biologically-treated sewage demonstrated that the dissolved CO2 and HCO3 continually produced in the system were essentially depleted by the autotrophic organisms during daylight hours, while the concentration of phosphorus remained unchanged. Addition of organic carbon and inorganic nitrogen and phosphorus alone and in combination to the waters studied directly stimulated the oxidative metabolism of the heterotrophic population, which resulted in increased dissolved CO2 and HCO3. This increased availability of inorganic carbon, rather than the direct metabolic removal of dissolved phosphorus by the algae, appeared to be directly responsible for the growth of the algal populations in the waters studied. TREATMENT OF ACID MINE DRAINAGE BY REVERSE OSMOSIS.
Mar 70, 42p FWPCA-14010-DYK-03/70, W71-00477
Grant FWPCA-14010-DYK
Prepared in cooperation with the Commonwealth of Pennsylvania Department of Mines and Mineral Industries. Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $0.55 as I67.13/4: 14010DYK03/70.

Descriptors: (*Mine waters, *Osmosis), (*Water pollution, Mine waters), (*Water treatment, Mine waters), (*Demineralizing, Osmosis), Membranes, Field tests, Calcium inorganic compounds, Sulfates, Magnesium inorganic compounds, Iron inorganic compounds, Water supply.
Identifiers: *Mine acid drainage, *Reverse osmosis, *Water pollution control.

The report documents a study on the treatment of acid mine drainage by reverse osmosis. The objective of the study was to determine the feasibility of utilizing reverse osmosis to abate pollution due to acid mine drainage, and produce a water which could be used by industry or as a municipal water supply. A test site in Shickshinny, Pennsylvania was selected as a source of acid mine water for the study. A sample of this water was tested in a laboratory reverse osmosis unit to determine the design parameters for a 10,000 gallon per day demonstration unit. The results obtained during the demonstration period indicated that the reverse osmosis process has potential application in acid mine drainage treatment. A high quality water was produced which was suitable for use by industries or municipalities with a minimum of additional treatment. There are, however, operational problems which must be solved prior to utilizing reverse osmosis on a large scale. These include maintenance of high permeation rates through the membrane by reducing membrane fouling and determination of the optimum flow sheet for an acid mine treatment system utilizing reverse osmosis. FEASIBILITY OF A PERIODIC FLUSHING SYSTEM FOR COMBINED SEWER CLEANSING.
Final rept., Phase I.

Aug 67, 63p* FMC-R-2608 FWPCA-11020-DNO-08/67, W71-00623
Contract FWPCA-14-12-19

Descriptors: (*Combined sewers, *Flushing), Surface water runoff, Storms, Pollution, Test equipment, Design, Cost analysis, Cleaning, Feasibility, Automatic control.

One of the causes of pollution from stormwater overflow of combined sewers is the deposition of pollutional solids during dry weather flow followed by pick up of the pollutional material during storm flow when the flow be bypassed. As a solution to this problem, it has been proposed that a flushing system be used to periodically cleanse the sewers during dry weather and convey the solids to the treatment plant. A study was made of sewer flushing practices, application requirements, and hydraulic theory. Investigation was also made of sampling methods and equipment; flushing test equipment was designed and the cost was estimated. The existing information on sewer flushing has indicated a good possibility that a periodic flushing system would be feasible for reducing pollution from combined sewer stormwater overflow. The design of flushing evaluation equipment has been carried to the point that cost estimates can be made for construction of the equipment. A description of the design and the cost estimates are included. (WRSIC abstract)

Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $2.00 as I67.13/4:11034FKL.

Descriptors: (*Water pollution, *Surface water runoff), (*Storm sewers, Water pollution), Drainage, Urban areas, Abatement, Industrial wastes, Sewage, Nutrients, Coliform bacteria, Biochemical oxygen demand, Sediments, Phosphates, Nitrogen inorganic compounds, Chlorides, pH, Topography, Sampling, Oklahoma.
Identifiers: *Water pollution control, *Tulsa (Oklahoma).

An investigation of the pollution concentrations and loads from storm water runoff in an urban area was conducted in Tulsa, Oklahoma. The scope of the project included: a field assessment of the storm water pollution by obtaining samples of the water resulting from precipitation and surface runoff from selected test areas within the metropolitan area; development of an analytical procedure for correlation of storm water pollution with selectively defined variables of land uses, environmental conditions, drainage characteristics, and precipitation; and development of a plan for implementing remedial measures necessary to abate or control sources of pollution in an urban area. Storm water runoff samples were collected from 15 'discrete' test areas in the Tulsa metropolitan area for laboratory analysis in terms of quality standards for BOD, COD, TOC, organic Kjeldahl nitrogen, soluble orthophosphate, chloride, pH, solids, total coliform, fecal coliform, and fecal streptococcus pollutants. Selected land use parameters, environmental conditions, drainage and precipitation data, along with storm water pollution factors, provided input data for functional relationships to enable assessment of pollution from storm water runoff. Recommendations were made for a plan of action for preventing and controlling storm water pollution from urban areas. (Author)

Report on Optimization and Development of Improved Chemical Techniques for the Treatment of Coal Mine Drainage. Paper copy available from Superintendent of Documents, GPO, Washington, D.C. $1.25 as I67.13/4DAST33.

Descriptors: (*Coal mining, Mine waters), (*Water pollution, Mine waters), (*Mine waters, *Neutralizing), Drainage, Limestone, Particle size, pH, Particle shape, Calcium, Magnesium, Activated carbon, Zeta potential, Iron inorganic compounds, Magnetic separators, Sludge, Precipitates, Coagulation, Oxidation, Hydroxides, Pilot plants.
Identifiers: *Mine acid drainage, *Water pollution control, Iron hydroxides.

Four actual coal mine waters have been neutralized with limestone both on a batch scale and by utilizing a continuous flow apparatus. Variations in treatment procedure were necessary depending on the characteristics of the individual waters. A standardized test was established to evaluate the reactivity of the limestones. The following variables are of importance in evaluating limestones for coal mine water neutralization: (a) particle size, (b) Ca and Mg content, and (c) surface area. Ferrous iron oxidation has been accomplished with both synthetic and actual coal mine water at low pH in the presence of coal-derived activated carbon. Electrophoretic mobility studies on precipitates obtained by both lime and limestone neutralization of coal mine water yielded information which can be applied for more effective sludge removal. Magnetic sludges were prepared using two different iron-bearing waters. The conversion of precipitates to a magnetic form results in significant reductions in settled sludge volumes as well as increases in solids content. Data obtained in these studies indicate that the limestone process offers considerable promise for an improved lower cost method for treating several types of coal mine waters. (Author)

Identifiers: *Oil pollution, *Forensic chemistry, *Water pollution detection.

Several methods of identifying the source of oil pollution are critically examined. These methods are grouped into two categories: passive tagging and active tagging. Passive tagging assumes that oils are so chemically diverse that their contents constitute a stable chemical fingerprint that can be unequivocally disclosed in the laboratory. Active tagging requires that an inexpensive, coded material be added to oil; this material must be chemically and physically stable in both oil and oil slicks; it must also be readily identifiable by available analytical techniques; and it must have no adverse effect on the oil's subsequent use. Three methods of passive tagging (trace metals, sulfur-isotope ratios, and paper chromatography) and three methods of active tagging (halogenated polycyclic aromatics, organometallics, and coded microspheroids) have been examined. Passive tags cannot be recommended because the passive tags are quite likely to mingle, to evaporate, to be dissolved, or to be oxidized; even if these processes do not occur, they can create formidable forensic problems for the prosecution and telling counter-arguments for the defense. Since active tags are designed to be stable and identifiable, they are satisfactory for the job; and the three types of active tags reviewed show promise and merit. (Author)

Descriptors: (*Water flow, Hydraulic models), (*Water pollution, Control), (*Great Lakes, Currents), Simulation, Water quality, Wind, Dilution, Wastes, Mixing, Rivers.
Identifiers: Lake Erie.

Both analytical and experimental investigations are employed to provide basic information concerning water movement in the Lake. The knowledge and experience acquired in the course of this study should improve our capability to construct and operate rotating hydraulic models. This information should also assist in the overall water quality management of the Lake. The studies reported here deal with the idealized conditions of zero wind stress (including the inflow of the Detroit River and the outflow of the Niagara River) and, under this same flow condition, with the superposition of a uniform westerly wind over the surface of the Lake. The water mass is isothermal and variations in density are assumed absent. Under these conditions, investigations of the circulation patterns were conducted. Also studied was the oscillation of the entire water mass in the model lake. In particular, attention was given to the transient effect that this mass oscillation had on the otherwise steady-state circulation pattern and its effect on the mixing and dilution of waste discharges into the lake. (WRSIC abstract)

See also Part 1, PB-195 544.

Descriptors: (*Water flow, Hydraulic models), (*Water pollution, Control), (*Great Lakes, Currents), Simulation, Mathematical models, Wind, Water quality, Mixing, Dilution, Wastes.
Identifiers: Lake Erie.

The second report considers the experimental results obtained and the relationship of these results to various mathematical model approaches to the hydraulic study of Lake Erie. Based on the experimental and analytical results of this study, the following summarizing statements are made regarding the dynamic behavior of Lake Erie. In the absence of wind, the throughflow caused by the inflow of the Detroit River and the outflow of the Niagara River generates significant currents and easily observable patterns of circulation. The presence of westerly wind significantly alters the circulation pattern of Lake Erie as observed in the absence of wind. A procedure for relating model

wind speeds to prototype wind speeds based on similarity between wind set-up in model and prototype has been presented. (WRSIC abstract)

BIOLOGICAL WASTE TREATMENT IN THE FAR NORTH,
Sidney E. Clark, Harold J. Coutts, and Conrad Christianson. Jun 70, 54p* W71-01262, FWQA-1610-06/70

Descriptors: (*Sewage treatment, *Arctic regions), (*Activated sludge process, Arctic regions), Reviews, Aeration, Cold weather tests, Lagoons (Ponds), Aerobic processes.

A literature review to establish the state-of-the-are of biological waste treatment for cold regions applications was conducted. Comments were solicited from operating agencies throughout the cold regions of the Northern Hemisphere, particularly in the United States and Canada. These agencies have provided discussion of their experiences and offered their recommendations through letters and other forms of personal communications. The review centers on the feasibility for cold regions application of lagoons (aerated, facultative, and anaerobic) and extended aeration (12 to 36 hour detention activated sludge) with emphasis placed on the effectiveness of processes at low temperatures while treating domestic sewage. Although definite design criteria are not established, many of the recommendations and conclusions provide a better basis for cold regions design of biological waste treatment facilities. The limitations of existing knowledge are expressed and recommendations for continued research are presented. (Author)

Descriptors: (*Combined sewers, Overflows), (*Sewage filtration, Cost comparison), Solids, Removal, Surface water runoff, Water quality, Ozone, Chlorine, Coliform bacteria, Biochemical oxygen demand, Disinfection, Drainage, Cost estimates.
Identifiers: Microstrainer screens.

Microstraining (Trade Name), using a Microstrainer screen of a nominal aperture of 23 microns, removed up to 98% of the suspended solids from a combined sewer overflow. The sewer, in a residential area of Philadelphia, has an average dwf of 1,000 gph. The maximum combined sewer flow during rainstorms in one year of operation was 304,000 gph (11.3 cfs). Volatile suspended solids removals with the above screen have averaged 68% and 71% during different test periods. Results indicated that there was a slightly better kill of coliform group bacteria with chlorine than with ozone in the Microstrainer effluents when both were used at an initial nominal concentration of 5 ppm, with 5 to 12 minutes detention time. However, chlorine was applied at slightly higher levels and with better control than ozone. Preliminary estimates of the costs of treatment via Microstraining, using tentatively-established throughput rates, show that the capital costs per acre of drainage would be approximately $10,200 for Microstraining alone, $11,200 for Microstraining plus chlorination, and $19,800 for Microstraining plus ozonation. Of eight other currently-proposed schemes, whose costs were estimate, only surface impoundment (where aesthetically acceptable and where low cost land is available) appears competitive. (Author)

In order to accomplish the goals of the Water Quality Act of 1965, it is necessary to establish water quality surveillance systems throughout the nation. It is highly imperative that the individual systems developed by the various Federal, state, and interstate agencies be compatible and their data systems be interconnected. The various inputs and decisions necessary to accomplish this task are so complex that modern systems analysis techniques should be applied to insure that each of these water quality surveillance systems are developed and designed utilizing the same criteria. This study is the initial effort to apply systems analysis techniques to the solution of this problem. Three major river basins were selected for this study in order to identify the parameters common to any basin throughout the nation. The three basins were studied by: (1) reviewing the literature associated with their water quality characteristics; (2) on-site visits to the river basin areas; (3) comparative review of the interstate water quality standards and plans of implementation; and (4) legal considerations in surveillance program design. These tasks provided the input material to develop a systems analysis framework. The systems analysis framework was applied manually to select sites for water quality surveillance stations on the major streams studied within the three river basins. (Author)

COMBINED SEWER REGULATION AND MANAGEMENT. A MANUAL OF PRACTICE.
Water Pollution control research series.

Jul 70, 140p W71-01265, FWQA-11022-DMU-08/70
Contract FWQA-14-12-456
Paper copy available from Superintendant of Documents, GPO, Washington, D.C. 20402. $1.50 I67.13/4:11022DMO 08/70.

Descriptors: (*Combined sewers, *Control equipment), Regulators, Design, Maintenance, Performance, Cost estimates, Overflows, Manuals.
Identifiers: Tide gates.

Design application, operation and maintenance of combined sewer overflow regulator facilities are detailed in this Manual of Practice, developed in conjunction with a report prepared on combined sewer overflow regulators. Design calculations are given for various types of regulators and tide gates. A sample regulator facility control program is given to illustrate the development of a control system. Operation and maintenance guidelines are also given. Thirty-eight sketches and photographs are included. (WRSIC Abstract) (Sullivan-APWA Research Foundation)

BIOLOGICAL EFFECTS OF EFFLUENT FROM A DESALINATION PLANT AT KEY WEST, FLORIDA.
Water pollution control series,
W. D. Clarke, J. W. Joy, and R. J. Rosenthal. Feb 70, 103p W71-01266, FWQA-18080-DAI-02/70
Contract FWQA-14-12-470
Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402. $1.00 as 167.13/4:18050DAI-02/70.

Descriptors: (*Aquatic biology, Ecology), (*Ecology, *Effluents), (*Salinity, Aquatic biology), (*Desalting, Water pollution), Biomass, Environments, Florida, Tropical regions, Aquatic animals, Aquatic plants, Heat.
Identifiers: *Desalination plants, *Thermal pollution, Key West (Florida).

The Key West study was undertaken to determine the impact of the discharge from a large desalting plant on the surrounding environment. The Phase-I work has shown that some of the properties of the effluent can be detected by physical and chemical measurements well beyond the area that visible effects can be detected in the bottom communities. While the effluent produces some beneficial effects such as attracting certain species of fish and the stone crab, Menippe mercenaria, it has also been shown to have deleterious effects for other organisms. Algae, tunicates, and gastropods were excluded from the near-field of the effluent discharge and bryozoan colonies were not as numerous in the discharge area nor did they grow as well as they did outside of the area. Quantitative investigations of the physiological and ecological effects of the desalting plant effluent in future studies could lead to predictive capabilities as far as the amount of environmental stress that can be tolerated at a given locality. A STUDY OF HEAD AND NECK EXPOSURE FROM POLYTOMOGRAPHY.
J. Robert Cassady, and Robert N. Pierce. Nov 70, 18p* BRH/DEP-70-27

Descriptors: (*Radiography, *Radiation hazards), Radiation dosage, X rays, Exposure, Head (Anatomy), Neck (Anatomy), Partial body irradiation.
Identifiers: *Polytomography.

An investigation was conducted to determine radiation exposures to the head and neck regions of patients undergoing polytomographic studies of the sella turcica, paranasal sinuses, and petrous pyramid. The highest exposures were measured at the eyelid region for studies of the sella turcica and paranasal sinuses. In studies of the petrous pyramid, the highest exposures were recorded in the external auditory canals. Variation in the total number of exposures, the ratio of frontal and lateral exposures, and beam collimation are cided as principal causes of the wide range of values recorded for a given dosimeter location and type of examination. To reduce eye exposures, it is recommended that PA rather than AP projections be used for tomography of the petrous pyramid, scila turcica, sphenoid sinus, and other mid- and posteriorly-located structures of the skull. ment, Red Hill Land, Sheffield S3 7HQ (England). 4s 5d.

Descriptors: (*Boots (Footwear), Safety), (*Coal mining, Accident prevention), Studs, Tungsten carbides, Friction, Adaptation, Great Britain.
Identifiers: Mine safety.

A large and increasing proportion of the accidents occurring in British mines are caused by men losing their balance, and there is evidence that slipping plays a major part in many such accidents. Simple laboratory measurements of the frictional force between footwear and different floor materials with different surface conditions showed that existing types of miners' footwear did not give a good grip in all circumstances. In particular, although rubber-soled footwear gave an excellent grip on clean surfaces, it gave a very much reduced grip on greasy or muddy surfaces. An unexpected change in grip could cause men to slip. Boots fitted with tungsten carbide tipped studs, such as are fitted to types for motoring on ice, were tested and gave a reasonable grip which was almost unaffected by the condition of the surface. User trials of such studded boots have been encouraging and are being extended, most wearers being enthusiastic about the boots' anti-slip properties. Extensive tests are in progress on the frictional-ignition hazard presented by tungsten carbide tipped studs. It seems likely that the hazard will prove to be in the same low range as that given by hobnails and other steel fittings to footwear. Advice is given on where and how to insert studs into existing footwear and suggestions are made for future developments. The publication of the early results of the work has produced a lot of inquiry from industries other than coalmining and this brief report has been prepared to meet the needs of these other industries. Identifiers: *Air pollution detection, *Air pollution control.

A multi-faceted study was conducted to determine the nature of emission problems in the graphic arts and metal decorating industries. By means of field visits and a survey of solvent and ink use, the industry's actual and potential problems were delineated and methods used for solving these were reviewed. An industry sampling plan was developed that will measure and attempt to characterize the emissions, according to the process, type of ink coating and substrate used. Analytical procedures requisite to the chemical evaluation of effluents and sampling technique employed were examined and reviewed. The less complex method of total hydrocarbon analysis suffices for certain segments of the industry. Solvent flow charts for the basic printing processes and modifications thereof were utilized to indicate the process variables in terms of inputs and outputs. Significant emissions can be expected from web printing (letterpress and lithography using heatset inks), metal decorating, gravure and flexography. Control techniques were reviewed and presented. There are three general approaches to the problem of controlling gaseous emissions from the printing and metal decorating industries: the first, the use of air pollution control equipment, the second, a change of process materials and the third is process modification. All were considered from both a technological and economic review. Changes in process material (e.g., solventless or low-solvent inks) were reviewed. Developments in radiative drying were also discussed. (Author)

USE OF NEW ANALYTICAL METHODS IN WATER RESOURCE DEVELOPMENT.
Water pollution control research series.

Sep 70, 24p* W71-01658, FWQA-16110-FZE-09/70

Descriptors: (*Water resources, *River basin development), Economic analysis, Reservoirs, Dynamic programming, Algorithms, Optimization, Decision theory, Benefit cost analysis, Computer programming.

Studies were made to determine the feasibility of applying recently developed analytical techniques to the problem of planning for optimal water resource development. An optimal plan with regard to the size and location of proposed reservoirs was taken to be that physical configuration which provided the greatest net economic benefit to the people of the region while meeting future water needs. The research was aimed at providing an improvement over planning techniques which have not taken into account the interacting effects which exist between each reservoir and all downstream reservoirs. For the purpose of formulating a mathematical model for this type of problem, a number of recently developed optimization techniques were studied. The intercoupled staging structure of the process was exploited by means of nonserial dynamic programming algorithms developed in the course of the research project. (Author)

Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.25. I67.13/4:16110FPX08/0.

Descriptors: (*Water quality, Management), (*Water treatment, Mathematical models), Nonlinear programming, Algorithms, Cost analysis, Estuaries, Water treatment, Bypasses, Water pollution.

The application of a non-linear programming algorithm to the problem of optimal water quality control in an estuary is described. A mathematical model gives the solution to the general mixed case of at-source treatment, regional treatment plants, and by-pass piping. The non-linear algorithm is developed in considerable detail and a sample problem is worked out. Detailed results are presented for a pilot problem to illustrate the method of solution. Actual data from the Delaware Estuary is used to solve a large scale problem and the solution is given. (Author)

PATHO-PHYSIOLOGIC RESPONSE TO SINGLE AND MULTIPLE AIR POLLUTANTS IN HUMANS AND ANIMALS.
Final rept. 16 Jan 68-31 May 70,
Morton Corn, Nancy Kotsko, Dolores Stanton, William Bell, and Armand P. Thomas. 1 Jul 70, 136p APTD-0593
Contract PH-86-67-73

Descriptors: (*Respiratory diseases, *Air pollution), (*Sulfur dioxide, Respiratory diseases), (*Public health, Air pollution), Pathophysiology, Cats, Lung, Sodium chloride, Air flow, Nose (Anatomy), Pharynx, Concentration (Composition), Aerosols, Trachea, Respiration.
Identifiers: *Air pollution damage.

Twenty healthy, adult male cats were lightly anesthetized (Nembutal), tracheotomized and were then breathed by a Harvard pump at a fixed frequency and tidal volume. Purified Medical Grade breathing air with or without sulfur dioxide in air or sulfur dioxide in combination with sodium chloride aerosol in air, was delivered to the animals in predetermined exposure sequences and for fixed durations of time. Parameters of response used to judge adaptation of cats to the inhaled challenges of pollutants were pulmonary flow resistance and lung compliance. In addition, pollutant mixtures were delivered to animals via endotracheal catheter and/or face mask to evaluate the possible influence of receptors which may be present in the nasopharyngeal chamber and in the trachea above the tracheal cannula. The major finding was the variability of the responses of the test animals. Certain subjects showed increased pulmonary flow resistance at low SO2 concentration, and were the analogues of the 'reactors' in human populations. Approximately 20 ppm SO2 in air were required to evoke a significant change in pulmonary flow resistance in 'reactors'. The majority of animals showed no response at this concentration of sulfur dioxide in air, either alone or in the presence of NaCl aerosol. When the pollutants were administered via endotracheal catheter and face mask, an increased frequency of significant changes in pulmonary flow resistance in these animals was suggested. All alterations in parameters of response were reversible shortly after exposure ceased. Morphological examination of lung tissue sections after rapid freezing with Freon indicated that measurement of alterations in airway size is not possible in the range of changes of pulmonary flow resistance reported here (< 100%). Methods and data for all experiments are presented in detail.

DOSES TO THE CENTRAL NERVOUS SYSTEM OF CHILDREN RESULTING FROM X-RAY THERAPY FOR TINEA CAPITIS.
Technical rept.,
Wah Lee, and H. D. Youmans. Oct 70, 23p*
BRH/DBE-70-4

Descriptors: (*Radiation dosage, Central nervous system), (*Radiotherapy, Fungus diseases), (*Radiation dosage, Radiotherapy), Dosimetry, X rays, Brain, Eye, Thyroid gland, Exposure, Children.
Identifiers: Tinea capitis.

X-ray beam qualities of 72-118 kVp with HVT's of 0.66-3.9 mm Al were used to irradiate three head phantoms constructed from the skulls of 3-, 6-, and 12-year-old children using Mix D as soft tissue equivalent material. Thermoluminescent dosimeters were used for 'in phantom' exposure measurements. A relatively simple method was developed which yields an accurate estimation of dose distribution in the brain and doses to the eye and thyroid of children (ages 3-12) irradiated with any x-ray technique commonly employed for the treatment of tinea capitis. Typical ranges of doses to the organs of the head are: brain, 100-200 rads; lens of eye, 10-25 rads; and thyroid, 2-5 rads. (Author)

A PRACTICAL, MULTIPURPOSE URBAN DIFFUSION MODEL FOR CARBON MONOXIDE.
Final rept.,
F. L. Ludwig, Albert E. Moon, Warren B. Johnson, and Robert L. Mancuso. Sep 70, 184p* APTD-0604
Contract PHS-CPA-22-69-64

Descriptors: (*Urban areas, *Air pollution), (*Carbon monoxide, *Atmospheric motion), (*Exhaust gases, Atmospheric motion), Atmospheric diffusion, Meteorological data, Mathematical models, Periodic variations, Seasonal variations, Vehicular traffic, Mixing, Wind (Meteorology), Urban planning, Concentration (Composition).

The development and current status are described of a receptor-oriented diffusion model that can be applied to urban areas to give the following outputs: Carbon monoxide (CO) concentration isopleths for a given set of meteorological conditions and times of day. Sequences of hourly CO concentrations at specific locations for given sequences of meteorological conditions, climatological summaries of CO concentration for specific locations if an historical record of meteorological data is available. The model can be used to obtain the frequency distributions of concentrations averaged over various time intervals for specific hours of the day or days of the week. Model inputs are traffic volumes on major streets and highways in the urban area, atmospheric stability, mixing depth, and wind speed and direction. The concentrations calculated with the model are compared with observations of CO concentration from Continuous Air Monitoring Program (CAMP) stations. Although the agreement is not good--the model generally calculates concentrations lower than those observed--improvement is obtained by empirical corrections. Possible reasons are given for the disagreement between calculations and observations, and a field measurement program is described that the authors feel will help to define the sources of the discrepancies and provide the information necessary for their correction. Report on A Field Investigation to Locate and Define Unknown or Hidden Drift Mine Openings in the Browns Creek Watershed of the West Fork River in West Virginia. Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402, $2.00 as I67.13/4:14010-DMO-03/70-A.

Descriptors: (*Watersheds, *West Virginia), (*Coal mines, *Drainage), (*Water pollution, *Mine waters), Openings, Land surveys, Mine surveys, Strip mining, Augers, Probes, Abatement, Maps.
Identifiers: Harrison County (West Virgisia), Browns Creek watershed, *Mine acid drainage, *Water pollution control.

The primary purpose of this project was to conduct an investigation to locate hidden or unknown drift mine openings in the Browns Creek Watershed in Harrison County, West Virginia. Thirty unknown openings were discovered in an initial reconnaissance. Additional probing using power driven augers was not successful and was deemed impractical. Three specific areas within the watershed were selected for further scrutiny. The bottom of the highwall line in the strip mined area was determined by land surveyors and this information was plotted on old mine maps to indicate the intersection of the stripping with underground mining. A minimum of 107 mine drifts were shown to be exposed by the 14,500 feet of highwall surveyed in the three areas. (wrsic abstract).

Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402. $1.00 as I67.13/4: 15030-DIL-05/70

Descriptors: (*Soil erosion, *Urban areas), (*Sedimentation, Control), Watersheds, Management planning, Water pollution, Water law, Water resources, Surface water runoff, Reviews.

The study was conducted to determine the causes and the extent of urban and suburban soil erosion and sediment problems, and to describe ways in which local communities can organize and implement effective sedimentation control programs. An evaluation is provided on the state-of-the-art of urban sedimentation control, and a series of research needs in the sedimentation field is cited. In addition, this report includes the 'Community Action Guidebook for Soil Erosion and Sediment Control' which describes methods by which local governments can organize, plan, finance, staff, and implement urban sedimentation control programs. Aspects of areawide approaches, legal authority, and public support for sedimentation control are discussed, and an action plan is outlined. It was found that soil erosion and sediment in developing areas is extensive, and that these problems pose significant threats to both soil and water resources. While many of the required technical means for controlling sedimentation problems already exist, new administrative approaches are needed which accommodate the diversity of interests and pressures associated with urban and suburban development. (WRSIC Abstract).

NUTRIENT REMOVAL FROM ENRICHED WASTE EFFLUENT BY THE HYDROPONIC CULTURE OF COOL SEASON GRASSES.
Water pollution control research series,
James P. Law, Jr. Oct 69, 45p W71-02277, FWQA-16080-10/69
Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402. $0.50 as I67.12/4: 16080-10/69.

Descriptors: (*Waste water, Nutrients), (*Grasses, Hydroponics), (*Nutrients, Removal), Statistical analysis. Rye plants, Turf grasses, Nitrogen organic compounds, Phosphorous, Oxygen, Sewage.

Grasses were grown in hydroponic culture tanks to evaluate their nutrient removal capabilities when supplied with secondary-treated sewage effluent as the sole source of plant nutrients. Statistical methods were employed to determine the effects of the grasses, flow rates, and seasons on nutrient removal. Two control tanks with gravel bed and no grass were maintained throughout the study, two were planted with tall (Ky 31) fescue, and two were planted with perennial ryegrass. Two flow rates were maintained in each pair of tanks, approximately one-day and two-day detention times. All six tanks were effective in reducing the oxygen-demanding organic content of the effluent. Total nitrogen content was reduced appreciably by the control tanks, but the grass tanks were significantly better at nitrogen removal. Total phosphorus concentrations were reduced only slightly by passage through the tanks. The fast flow rate tanks produced the greater grass yields, while the slow flow rate tanks were more effective in nutrient removal from the sewage effluent. From grass yield and analyses data, the amount of plant nutrient material removed by the grasses was small compared to the total quantity supplied. (Author)

MICROBIOLOGICAL FACTOR IN ACID MINE DRAINAGE FORMATION. II. FURTHER OBSERVATIONS FROM A PILOT PLANT STUDY.
Water pollution control research series,
Robert A. Baker, and Albert G. Wilshire. Jul 70, 81p W71-02278, FWQA-14010-DKN-11/70
Grant FWQA-14010-DKN
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $0.70 as I67.13/4:14010-DKN-11/70.

Descriptors: (*Pyrite, *Biodeterioration), (*Microbiology, Coal mines), (*Water pollution, *Mine waters), (*Coal mining, Water pollution), Industrial wastes, Waste water, Acidity, Bacteria, Ferrobacillus, Thiobacillus, Iron, Sulfates, Iron sulfides, Aerobic bacteria, Algae, Growth, Aerobic processes, Metabolism, Flow rate, Aeration.
Identifiers: *Chemoautrophic microorganisms, *Mine acid drainage.

The role of chemoautrophic organisms in the formation of acid mine drainage from pyritic materials associated with coal mining has been investigated by pilot plant techniques. Dynamic flow, controlled environment units which served as models of mines were used. It was demonstrated that the concentration of acidity, ferrous and total iron and sulfate in the effluent from aerobic, biologically-seeded or unseeded pyritic beds is zero order with respect to flow, except at low flow rates where mass transport is diffusion limited. Algal growth occurred in the acidic, aerobic environment but did not affect acid production. Nonaerobic systems produce acidity consisting only of ferrous iron. Total acidity is lower from biologically-seeded than -nonseeded aerobic systems. Acid mine drainage was not significantly affected by seeding with the individual or a mixture of three different organisms but was increased by recycle of the flow and increased appreciably under forced aeration. The rate is directly related to the available pyrite surface area. (WRSIC abstract)

Descriptors: (*Earth fills, *Refuse disposal), (*Garbage disposal, Earth fills), (*Sanitary engineering, Earth fills), Waste disposal, Aeration, Percolation, Anaerobic conditions, Aerobic processes, Gases, Compacting, Field tests, Rainfall intensity, Climate, Settling.
Identifiers: *Sanitary landfills, *Solid waste disposal.

Model sanitary landfill cells were constructed and, over a 4+ year period, subjected to simulated environmental conditions such as added water, aeration, and aerobic and anaerobic operation. The effect of these conditions on percolation, gas quality and production, settlement, and temperature was measured. Examination of core samples taken at the end of the study period showed that refuse in the aerated cell was well decomposed except for plastics and other inerts and that refuse in the anaerobic cells was easily identifiable. Based on an original cell depth of 20 feet, volume reduction in the aerated cell was 21.5% and in the anaerobic cells, 11.5%. The four parts of the report detail the activity during the last year of the project and summarize the data collected for the span of the project 1964-1968. (Author)

CYCLOTRON PRODUCTION OF 123I- AN EVALUATION OF THE NUCLEAR REACTIONS WHICH PRODUCE THIS ISOTOPE,
Vincent J. Sodd, Kenneth L. Scholz, James W. Blue, and Henry N. Wellman. Oct 70, 49p
BRH/DMRE-70-4
Prepared in cooperation with National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.

Descriptors: (*Iodine isotopes, Production methods), Radiation dosage, Nuclear reactions, Dose rate, Drugs, Spectrum analysis, Cyclotrons.
Identifiers: *Iodine 123, Radio medicine.

The document was prepared by the Nuclear Medicine Laboratory of the Division of Medical Radiation Exposure. The purpose of this research was to establish and describe the use of the various nuclear reactions by which 123I, a superior, low-radiation dose radiopharmaceutical, can be cyclotron-produced. Herein are reported both the methods of directly producing 123I and those which indirectly produce the radionuclide through the positive beta decay of its natural precursor, 123Xe. It is impossible to separate 123I from the troublesome radioiodine contaminants, notably 124I, which occur in the direct method. Thus, it is much preferable to produce pure 123I from 123Xe, which is easily separated from the radioiodines. It is hoped that the findings of this research will stimulate the use of 123I. Among its desirable characteristics is the capability of reducing the patient dose in a thyroid uptake measurement to a very small percentage of that delivered by the more commonly used 131I. Since 131I has been found responsible for most of the absorbed tissue dose in nuclear medicine, general adoption of pure 123I could have far-reaching effects in reducing the medical radiation dose to the pulation. The state of technology of electrostatic precipitation for particulate emission control is reported. The report is intended to serve as a basic handbook on the subject of electrostatic precipitation covering the entire system including fundamental theory, design, operation, and application. Its purpose is to provide a source of information that will be of benefit to the researcher, manufacturer, and user of electrostatic precipitators. The systems study included a review of literature pertaining to electrostatic precipitation, a comprehensive review of precipitator fundamentals, a survey and review of the use of precipitators in each of eight major application areas, and a review of the potential for electrostatic precipitators in new applications. In order to provide information useful to a wide range of users, this manual is organized to present a general review of the precipitation process, with qualitative relationships between the various precipitator functions, and a detailed quantitative analysis of each of the system functions. Particular emphasis is placed on the validity of the theoretical derivations in view of the assumptions made and the significance of the interaction of variables of importance in precipitator operation. Further discussions include mechanical design considerations, energization equipment, gas flow, operational problems, and the current utilization of precipitators in the major application areas. Descriptors: (*Electrostatic precipitators, *Reviews), (*Air pollution control equipment, Electrostatic precipitators), (*Handbooks, Electrostatic precipitators), Manuals, Steam electric power generation, Sulfate pulping, Paper industry, Steel making, Metal industry, Cement industry, Chemical industry, Incinerators, Petroleum refining, Dust, Aerosols, Sulfur dioxide, Fly ash, Iron and steel industry, Sulfuric acid, Phosphoric acid, Air filters, Efficiency, Cost estimates.

The report presents information based on records covering electrostatic precipitator installations in the various application areas. To supplement this data a number of installations in various industries were surveyed. In some instances, considerable data were available covering both design and performance of the precipitators. In other instances, data were not available. Consequently, the extent and quality of the information covering the application areas varies. Chapters are included on: electric power generation; pulp and paper; iron and steel industry; rock products; chemical industry; municipal incinerators; petroleum industry; nonferrous metals; high temperature, high pressure gas cleaning; and new application areas.

A TRAINING MANUAL FOR NUCLEAR MEDICINE TECHNOLOGISTS.
Technical rept.,
Guy H. Simmons, and George W. Alexander. Oct 70, 225p BRH/DMRE-70-3
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.75 as HE20.1508:N88.

Descriptors: (*Radiobiology, Manuals), (*Medical personnel, Nuclear radiation), (*Medicine, *Nuclear radiation), Training, Education, Radioactivity, Radiation measuring instruments, In vivo analysis, In vitro analysis, Radiotherapy, Radiation dosage, Diagnostic agents, Isotopic labeling, Dosimetry.
Identifiers: *Nuclear medicine, Medical technologists, *Nuclear medical technologists.

The manual was prepared for the training program in Nuclear Medicine Technology at the University of Cincinnati. The program in which this manual is used leads to the Bachelor of Science degree in Medical Technology with a Nuclear Medicine option. This manual is used in teaching nuclear physics and instrumentation, radionuclide measurements, radiation protection, and tracer methodology and radiopharmaceuticals. It is offered as an addition to the exiguous literature presently available to those who wish to train Nuclear Medical Technologists. Since college level courses in anatomy and physiology, chemistry, physics, and basic mathematics are prerequisite to the internship in which this manual is used, the fundamentals of these sciences are not included except for the mathematics review in the appendix.

A STUDY TO DETERMINE THE NECESSITY FOR THE DEVELOPMENT OF STANDARDS FOR THE USE OF SELECTED NONMEDICAL ELECTRONIC PRODUCTS FOR COMMERCIAL AND INDUSTRIAL PURPOSES,
Walter E. Gundaker, Thomas M. Moore, and Steven A. Coppola. Dec 70, 119p* BRH/DEP-70-30

Descriptors: (*Radiography, Safety), (*Particle accelerators, Safety), (*X ray apparatus, Safety), (*Safety, Electric equipment), Standards, Radiation hazards, Fluoroscopes.

The report presents the findings of a study conducted during 1969 to determine the need for developing standards for the use of selected non-

medical electronic products for commercial and industrial purposes. Three classes of products were investigated: industrial radiographic and fluoroscopic x-ray units, particle accelerators, and analytical x-ray equipment. For each category the equipment, its typical uses, and the attendant radiation hazards are described, and radiation safety measures are discussed. Existing guidelines and controls for each class of equipment are presented, and incidents involving radiation exposure are reviewed. The need for standards for the use of the equipment is also discussed. (Author)

Identifiers: *Air pollution control.

The purpose of the study was to identify the costs and to assess the economic impact of controlling air pollution from gray iron foundries. Two principal considerations commend the gray iron foundry industry to this type of study. First, the industry is an important source of particulate pollution in most urban metropolitan areas (170,000 tons in 1968). Second, the industry includes a large number of small establishments that may find it difficult to finance the purchase and operation of pollution control equipment. Approximately a third of all companies in this industry employ less than 20 employees. Pollution control costs are examined for the various types of systems commonly applied to reduce furnace emissions. Factors that may influence control costs are tested between the different types of control systems and within types of a systems. Costs of control are measured against the economic strength of the industry and against the financial condition of firms in the industry. Two types of data were collected, individual company data and aggregated industry data. All the known producers of gray iron were surveyed by mail in 1968 to determine which ones had installed pollution control equipment, the types of equipment, and the costs.

Identifiers: *Air pollution control.

Four alternate methods suggested in the report which this one supplements are explained in detail. The most economical method to determine the reduction of sulfur from a given raw coal is based on beneficiation equipment currently used by coal washing contractors; it involves extensive laboratory testing from suitable raw coal samples. If carried out in one of the existing government laboratories it would involve no capital investment; operating costs would also be small. In case a plant is desired to demonstrate in actual practice the reduction of sulfur as well as to generate data for a given coal, it will be of substantial value both from a scientific and commercial standpoint to build a full scale commercial plant. Being capable of operation at a full commercial rate, this facility would be able to provide an adequate return on the total investment. It would be an added advantage if cooperation could be obtained from a large coal company to run the plant. (Author)

Identifiers: Secondary sewage treatment.

Digester supernatant contains high concentrations of nitrogen and phosphorus. Also, poor quality supernatant discharged from an anaerobic digester can have an adverse effect on the overall efficiency of a wastewater treatment plant. The report discusses the building and demonstrating of a unique, trailer-mounted, and completely self-contained pilot plant. The pilot plant is designed to investigate the improvement of digester supernatant quality, with particular emphasis on the removal of nitrogen and phosphorus. The pilot plant treatment sequence consists of carbon dioxide removal via air-stripping, lime precipitation of phosphorus and carbonaceous particulate matter, and removal of nitrogen by packed-tower ammonia-stripping. The pilot plant was operated over a two-month period at a trickling filter plant where two-stage anaerobic digestion is practiced. It was found that 80-95% of supernatant phosphorus could be removed at a lime dosage equal to 50 pounds of hydrated lime per pound of phosphorus removed. Average ammonia-nitrogen removal was 82%, achieved at an air flow rate equal to 83,000 cubic feet of air per pound of NH3-N removed. Normal

lime precipitation removed about one-half of the supernatant TOC, COD, AND Organic Nitrogen. The average decrease in ruspended solids was 64%. (Author)

Descriptors: (*Water pollution, Phosphates), (*Sewage treatment, *Phosphates), (*Precipitation (Chemistry), *Phosphorus inorganic acids), (*Sewage filtration, Sewage treatment), (*Alums, Sewage treatment), (*Coagulation, Sewage treatment), Cost estimates, Anion exchanging, Polyelectrolytes, Trickling filtration, Clarification, Biochemical oxygen demand, Pilot plants, Flocculation, Nutrients, Chemical removal (Sewage treatment).
Identifiers: Secondary sewage treatment.

A continuous precipitation and countercurrent filtration process was evaluated for the removal of phosphorus from municipal wastewater. Using alum and an anionic polyelectrolyte, the process was found to effectively reduce total phosphorus (TP), orthophosphate (OP) and condensed phosphate (CP) over a wide range of influent phosphorus concentrations. Preliminary work using jar tests established an alum dose of 200 mg/l (17.4 mg/l Al, molar ratio of Al1P is 27/31) as effective for removal of 90 per cent TP from the secondary clarifier effluent of a trickling filter plant. This removal efficiency could not be sustained with an alum dose of 200 mg/l when higher TP levels were encountered. Substantial reductions in final effluent total suspended solids (TSS) and 5-day biochemical oxygen demand (BOD5) were also obtained. The 200 mg/l alum dose was also found to be equally effective for removal of phosphorus from raw sewage and primary effluent with the added capability for removing substantial portions of the TSS and BOD5. Costs for a 1.0 MGD plant are estimated to be $264,000 for capital and 12.0 cents per 1000 gal for total operating cost. Ultimate disposal of the phosphorus-containing sludge could be achieved by a dewatering and landfill operation. (Author)

Identifiers: *Waste water treatment, Poly (ethylene/ ((((naphthylmethyl)amino)methyl)p henyl)), Water pollution control.

Preparation of nitrate-specific ion-exchange resins, which incorporate selected primary amines grafted onto polystyrene, has been investigated. The best selectivity for nitrate ion over chloride ion was obtained with the 1-naphthylmethlaminomethyl derivative of polystyrene (1-NMA resin). Nitrate was adsorbed quantitatively from feed solutions containing five times as much chloride ion as nitrate ion. Under identical conditions, commercial weak-base resins removed only 70% of the nitrate ion. The 1-NMA resin could be regenerated repeatedly in the chloride form by HCl, but attempts at alkaline regeneration led to irreproducible results. Recommendations for future work include investigation of the effects of cross-linking, addition of hydrophilic functional groups, quaternization of the amine, and incorporation of different, nitrate-selective, functional groups. NEW MINE SEALING TECHNIQUES FOR WATER POLLUTION ABATEMENT.
Water pollution control research series.

Mar 70, 177p W71-03456, FWPCA-14010-DMO 03/70
Contract FWPCA-14-12-453
Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402. $1.50 as I67.13/4:14010-DMO-03/70.

Descriptors: (*Water pollution, *Mine waters), (*Coal mines, Sealing), (*Mine shafts, Sealing), Acidity, Limestone, Aggregates (Materials), Permeability, Grouting, Neutralizing, Subsurface drainage, Cements, Cost estimates, Sodium silicates, Feasibility, West Virginia, Bulkheads.
Identifiers: *Mine acid drainage, *Water pollution control.

The purpose was to develop and field test new concepts for watertight mine seal and bulkhead construction applicable to abatement of acid mine water pollution. Laboratory research determined proper materials, equipment and techniques for constructing mine seals or bulkheads. Field testing was conducted on remedial grouting techniques for constructing mine seals or bulkheads. Two new processes were developed. One involved a technique of placing a plug or graded limestone aggregate in a mine drift or portal to neutralize an acid mine water discharge until a seal was effected. The second process consisted of remotely constructing a mine seal including rear and front bulkheads of a self-supporting, quick-setting sodium silicate cement specifically developed for this application. A filler material of expansive cement was used between the bulkheads to complete the seal. Field testing in West Virginia substantiated the feasibility of both processes when two aggregate and two bulkhead type seals were placed in abandoned mines which had drainage flows up to 58 gallons per minute. Cost of the seals are reported. (Author)

Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402. $0.75 as I67.13/4:17010-EKI-04/70.

Descriptors: (*Water pollution, Phosphates), (*Sewage treatment, *Phosphates), (*Precipitation (Chemistry), *Phosphorus inorganic acids), (*Aluminum, Sewage treatment), Iron, Evaluation, pH, Settling, Solubility, Precipitates, Turbidity, Nutrients, Chemical removal (Sewage treatment).

An investigation was conducted of the rate, mechanism and stoichiometry of phosphate precipitation with aluminum and ferric salts from pure phosphate solutions and secondary effluent. These studies showed that the reactions of orthophosphate ion with both Al (III) and Fe (III) are completed in less than 1 second. The effects of pH, reactant concentration, and reagent aging on the efficiency of phosphate removal were evaluated in batch precipitation experiments. The pH of optimum orthophosphate precipitation was found to be close to 6.0 for Al (III) and in the vicinity of 3.5 to 4.0 for Fe (III). At constant pH, with both Fe (III) and Al (III) up to about a 1:1 molar ratio, orthophosphate removal was directly proportional to amount of added cation, indicating occurrence of a chemical reaction. Dilute solutions of Fe (III) were found to undergo extensive hydrolysis on aging with a resultant loss of capacity to precipitate phosphate. The removal of condensed phosphates by precipitation with aluminum and iron salts was found to be strongly dependent on pH and the reactant concentration ratio. Precipitates obtained in the reaction of orthophosphate with aluminum and ferric salts were examined by X-ray diffraction analysis after drying and heating to 104C and to 600C. Both precipitates remained amorphous, except that ferric phosphate was identified after ignition at 600C. (WRSIC abstract)

PHOSPHATE REMOVAL FROM WASTE WATERS USING LANTHANUM PRECIPITATION.
Water pollution control research series,
Howard L. Recht, and Masood Ghassemi. Apr 70, 54p* W71-03458, FWQA-17010-EFX-04/70
Contract FWQA-14-12-183
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $0.55 as 167.13/4: 17010-EFX-04-70.

Descriptors: (*Water pollution, Phosphates), (*Sewage treatment, *Phosphates), (*Precipitation (Chemistry), *Phosphorus inorganic acids), (*Lanthanum, Sewage treatment), Evaluation, Turbidity, pH, Solubility, Precipitates, Settling, Nutrients, Chemical removal (Sewage treatment).

A parametric study was made of the removal of ortho- and polyphosphates from pure solutions and secondary effluent with La (III), and the results compared with those from similar tests with Al (III). The reactions of orthophosphate with both La (III) and Al (III), resulting in precipitate formation and phosphate removal, were complete in less than 1 sec. La (III) showed a broader effective pH range and lower residual phosphate concentration and thus proved to be far superior to Al (III) for phosphate, especially polyphosphate, precipitation. Within the pH range for optimal phosphate removal, the La (III)-phosphate reactions produced large, settleable flocs. Immediately outside this range, poorly settling fine turbidity developed. At pH levels above this region, some residual turbidity was generally observed. No turbidity or precipitation was observed at very low pH levels. The results suggest that orthophosphate removal with La (III) occurs solely through a chemical reaction and not through an adsorption process. With secondary effluent, as with pure solutions, lower residual phosphate resulted over a wider pH range with La (III) than with Al (III); no pH adjustment is needed for effective removal with La (III), while considerable amounts of acid or excess Al (III) are required to achieve the optimum pH of 6 for phosphate removal. ULTIMATE DISPOSAL OF PHOSPHATE FROM WASTE WATER BY RECOVERY AS FERTILIZER.
Water pollution control research series,
Maria G. Dunseth, Murrell L. Salutsky, Kenneth M. Ries, and Joseph J. Shapiro. Jan 70, 81p* W71-03459, FWQA-17070-ESJ-01/70
Contract FWQA-14-12-171

Paper copy available from Superintendent of Documents GPO, Washington, D.C. 20402. $0.70 as I67.13/4:17010-ESJ01/70.

Descriptors: (*Water pollution, Phosphates), (*Precipitation (Chemistry), *Phosphorus inorganic acids), (*Sewage treatment, *Phosphates), (*Fertilizers, Sewage treatment), (*Chemical removal (Sewage treatment), Phosphates), Digesters, Ammonium compounds, Magnesium inorganic compounds, Calcium phosphates, Heat treatment, pH, Activated sludge process.
Identifiers: *Ammonium magnesium phosphate.

Many of the proposed processes that reduce orthophosphate in the effluents from sewage treatment plants result in the extracted phosphate being concentrated in the digester supernatant. This phosphate must be removed prior to disposal of the supernatant or its recycle back to the head of the treatment plant. Digester supernatant was treated in two ways. The first was to add magnesia and elevate the pH to 9 to cause precipitation of the phosphorus. The other technique was to apply heat and/or vacuum to the digester supernatant which caused precipitation of the soluble orthophosphate. A 90% removal of orthophosphate can be achieved by either approach. The heat and/or vacuum process also yields a supernatant substantially lower in BOD, COD, and nitrogen concentration. The precipitated phosphorus (primarily a mixture of calcium phosphate and magnesium ammonium phosphate) was found available for plant food. Work was conducted by bench and pilot plant studies on digester supernatant.

FWQA-17010-DHK-08/69
Contract FWQA-14-12-485
Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402. $0.50 as I67.13/4:17010-DHK-08/69.

Descriptors: (*Water pollution, Phosphates), (*Sewage treatment, *Phosphates), (*Vermiculite, *Adsorbents), (*Ion exchanging, *Phosphorus inorganic acids), Aluminum inorganic compounds, Cost estimates, Economic engineering, Aluminum sulfates, Adsorption, Materials recovery, Nutrients, Chemical removal (Sewage treatment).

The objective of the study was to prepare a chemically treated vermiculite with a high phosphate capacity that could be economically regenerated. Many alumin um vermiculites were prepared and tested for phosphate removal. 10 mg PO4/gram of treated vermiculites was the maximum capacity obtained. Highest phosphate capacities were obtained with materials prepared at relatively low pH (3.0) and dilute aluminum solutions (0.1-0.05M). Experimental results showed hydroxylated aluminum vermiculite is inactive towards phosphate ion. The mole ratio of phosphate adsorbed to exchanged aluminum seemed to approach 0.33, or an exchange capacity of 13.7 mg PO4/gm. The most successful regeneration scheme was one in which a dilute sulfuric acid solution containing a small amount of Al2 (SO4)3 was used as a regenerant. No significant differences in capacity were found between thermally and chemically exfoliated vermiculite. Vermiculites containing cations other than Al were also prepared. These included Fe (III), Fe (II), La (III), and Cu (II). None appeared more promising than Al-vermiculite. The adsorption isotherm of aluminum-vermiculite was obtained, and the data were found to fit both the Langmuir and Freundlich plots. (WRSIC abstract)

Identifiers: Gas surface interactions, *Surface chemistry, *Air pollution control.

Improved experimental equipment and analytical techniques have enabled more detailed study of the reaction between Limestone 2061 and SO2 in flue gas. Progress was made in analysis of results and development of techniques for prediction of performance of the process in a boiler by means of both empirical and theoretical evaluation of various aspects of the process. Results obtained for Limestone 2061 indicate: (1) maximum reactivity at injection temperatures not exceeding about 2200 F, (2) reduced sorption efficiency at low SO2 concentration, (3) possible improvement in the efficiency of the process at excess oxygen levels above 3 percent, and (4) reduced efficiency as a result of use of precalcined stone. CLINICAL AND BIOCHEMICAL APPROACHES TO THE STUDY OF LEAD AT LOW LEVELS,
L. B. Tepper, and E. A. Pfitzer. Feb 70, 31p
APTD-0617
Contract PHS-CPA-70-14, Grant PHS-ES-00159

Descriptors: (*Lead inorganic compounds, Public health), (*Air pollution, Lead inorganic compounds), (*Public health, Air pollution), Diseases, Humans, Effectiveness, Lead (Metal), Absorption (Biology), Clinical medicine, Biochemistry, Diagnosis.

Discussions were held in February, 2970, which attempted to: (1) identify biochemical and clinical approaches to the detection of lead effects at low levels; (2) establish the health significance of whatever lead-related phenomena might be observed at these levels; and (3) suggest possible areas in which research emphasis might be most fruitful in solving the presented problems. Those discussions are summarized. Increasingly sophisticated methodology is being used to study the manifestations of excessive lead absorption. The state of current knowledge about how lead interacts with man and experimental living systems was reviewed. The best indicators of early response to lead are already in use. (Author)

Identifiers: *Air pollution control, *Waste gas recovery.

The feasibility was studied of recovering the unreacted lime from limestone modified flyash by froth flotation of 200 x 325 mesh fractions. Grades of lime recovered were as high as 80 percent; 47.6 percent grade had been obtained in the preliminary tests. However, as lime grade increased, the recovery of lime decreased. This was attributed to the embedding of small siliceous particles in the lime constituents and the coating of the siliceous coal ash fraction with soluble lime. Tests have indicated that the lime may be liberated by attritional scrubbing and that carbonation and the use of chemical modifiers reduce coating of the siliceous coal ash fractions with lime. Employment of carbonation for pH and soluble lime control, modifiers for zeta potential control, agglomerate (emulsion) flotation and recleaning of the lime concentrates did not improve the yield and grade of lime to permit recovery of a majority of the lime in a highly concentrated form. Identifiers: *Waste gas recovery, *Air pollution control.

The program included: literature survey; preliminary economic evaluation for comparative purposes; selection of candidate processes; and process simplification and improvement of each candidate existing process; demonstration of process feasibility of any candidate new process; plant-scale evaluation and cost estimates for the candidate processes to both new and existing power plant facilities and to a new smelter facility. Of the four candidate processes the Zinc Oxide process was considered to merit further study, both in the form of a fluidized bed and in the form of the original Na+ scrubbing process to the small-scale pilot stage. The three remaining candidate processes (Cominco Exorption, Ammonia-Hydrazine Exorption, and Mitsubishi Lime) are not considered to be as economically attractive as the original Johnstone process. A major problem confronting any aqueous process in which sulfur dioxide is recovered as such is that of oxidation in the scrubber. Nearly 700 references are listed, with an author index. (Author)

Identifiers: *Waste gas recovery, *Air pollution control.

Efficient absorption of SO2 at flue gas concentrations can be effected through the use of dry, fluidized basic materials in the range of 50 to 60 C, if sufficient water is incorporated into the gas phase upstream of sorbent contactor. The formation of sulfate can be essentially eliminated in a fluidized bed absorber, and reduced to a very low value in an aqueous absorber, through the use of ferrous ion in an aqueous prescrubber to reduce NO2 to NO. The thermal decomposition of both zinc and magnesium sulfites is markedly promoted by the presence of steam. A new process for the removal of SO2 from flue gas is described in which dry fluidized zinc oxide is used as the absorbent. The oxide is recovered for reuse upon thermal decomposition of the resulting sulfite, and the liberated SO2 is recovered as such. Little or no sulfate is formed. NOx (especially NO2) is the major contributor to oxidation of the sorbent in aqueous solution systems. The efficiency of SO2 removal from flue gas is not affected by the presence of NOx. The economics of the conceptualized fluidized-bed zinc oxide process appear to be superior to other regenerable processes for the removal of SO2 from flue gases. (Author)

Identifiers: *Automobile exhausts, *Ethane/dibromo, *Ethane/dichloro.

Methods were developed of generating, collecting, and analyzing particulates in automotive engine exhaust by a means sufficiently accurate and reproducible to allow determination of the effects of fuel additives on exhaust particulate size, concentration, and composition. An air dilution chamber was designed which allows for cooling, dilution, and mixing so that representative particulate samples can be obtained at a sampling station which is essentially equivalent to 8 - 10 feet downstream of the end of the exhaust pipe on a vehicle at highway speeds. A 1970 Chevrolet 350 CID engine of 9.0:1 compression ratio with a standard exhaust system attached, was loaded by means of an engine dynamometer. Special analysis techniques were developed for the analysis and characterization of exhaust particulates. The data suggest a very significant effect of fuel additives, primarily tetraethyl lead, on exhaust particulate size, concentration and composition. Significant differences are observed with minor changes in other fuel additives. (Author)

Identifiers: *Waste gas recovery, *Air pollution control.

Ammonia scrubbing and production of phosphate fertilizer has promise, under certain conditions, as a method for recovering sulfur oxides from stack gases. The main economic factors are product volume (depending on power plant size and S content of coal), net sales revenue, and basis of financing. Private industry participation in financing and operation appears unlikely because of the high projected cash flow necessary to attract capital. There is a net profit for plants about 500 mw and larger but it is not large enough to attract investment except perhaps under special conditions. The situation is improved if there is supplemental income in the form of a payment for the service of sulfur oxide control; in this case the larger product volumes (e.g., 1000 mw at 3.5% S in coal or 500 mw at 5% S) give a projected total income adequate for financing. The economics under power industry financing are more promising. For plants 500-600 mw and larger in size the recovery method is favored over limestone - wet scrubbing because there is less deficit passed on to the power consumer after payment to investors of the regulated return on investment. Only a few recovery installations of this type can be accommodated by the fertilizer market. (Author)

Identifiers: *Foreign countries, *Air pollution control.

Over one thousand organizations dealing with air pollution control activities in 14 countries are included in the context of their functions in each country. Geography, political background, administration and finance of national and local control programs, current interests, proposed control programs and time tables for meeting goals are described in textual format for Austria, Belgium, Switzerland, Denmark, France, Great Britain, Italy, Japan, Norway, Netherlands, Sweden, and Soviet Union with similar descriptions for 19 international organizations. Where applicable publications relating to air pollution are also listed. Although cross-referenced in the text, each individual organization is outlined in aseparate section that is also divided by countries. The outline not only describes aims and functions but also key personnel and complete addresses. Functional and geographical cross-indexes within and across countries facilitate use on an issue-oriented basis. The report is a working document for preparing the second-year, supplemental report which will contain additional countries, as well as additional information for the countries already listed. STUDIES ON ICE FOG.
Final rept.,
Takeshi Ohtake. Jun 70, 204p UAG-R-211
APTD-0626
Contract PHS-AP-00449

Descriptors: (*Ice fog, Research), Air pollution, Condensation nuclei, Particle size, Nucleation, Dust, Freezing, Drops (Liquids), Precipitation (Meteorology), Electron microscopy, Water vapor, Condensing, Alaska.

In order to clarify the mechanism of ice-fog formation, various atmospheric factors in ice fogs such as size and concentration of ice-fog crystals, condensation nuclei and ice nuclei, amount of water vapor, temperature profile near the sources of ice fog, etc. were measured. Nuclei of the ice-fog crystals were studied by use of an electron microscope and electron-diffraction. Most nuclei of ice-fog crystals were combustion by-products and many individual crystals collected near open water did not have a nucleus, especially at emperatures below -40C. Dust particles or particles from air pollution are not essential for formation of ice fog; they merely stimulate freezing of water droplets at higher temperatures than the spontaneous freezing temperature. The essential factor is to first form many water droplets in the atmosphere through condensation of water vapor. Based on these measurements and calculations of time required for water droplets to freeze, a physical mechanism of ice fog formation is proposed as follows: (1) Water vapor coming from open water which is exposed to a low temperature atmosphere, plus water vapor from various exhausts of combustion processes is released into the almost ice-saturated atmosphere and condenses into water droplets, (2) The droplets freeze very shortly after their formation and before entirely evaporating, (3) Such ice particles do not evaporate or grow much and stay in the atmosphere with insignificant fall out, and (4) These processes operate more efficiently in colder environments. A REVIEW OF RADIUM TOXICITY STUDIES.
Technical rept.,
Richard P. Chiacchierini, Gordon L. Jessup, Neal S. Nelson, Norman C. Telles, and Edythalena Tompkins. Dec 70, 40p* BRH/DBE-70-5

Descriptors: (*Radium, Toxicity), Radiation dosage, Radiation effects, Thresholds (Perception), Sensitivity, Responses, Radiation tolerance, Public health, Humans, Animals.

The debate concerning the linear or threshold response of somatic radiation injury has recently been focused on the human radium toxicity studies. Because of the critical public health significance of the data derived from these studies, a task group from the Division of Biological Effects of the Bureau of Radiological Health undertook a review of the available human and animal radium studies for the purpose of determining the extent to which animal and human data are sufficient to resolve the questions of a dose-response relationship. The review contained in this report indicates that the animal and human radium experience to date is not sufficient to specify an unequivocal dose-response model. Therefore, in the low dose regions expected to be experienced by the general public, the assumption of a linear, non-threshold model continues to be a prudent health philosophy for standards setting. Identifiers: *Wellman-Lord process, *Waste gas recovery, *Air pollution control.

The application of the Wellman-Lord SO2 recovery process to power plant flue gases is described. A block flow diagram was prepared. Mass and volume flow balances were estimated. Engineering estimates of the capital investment and the total annual cost (including both fixed and variable charges) were prepared. These engineering estimates were applied to previously created model gas streams and the total annual cost for each was determined. From these annual costs, incremental production costs were estimated. The technical constraints on the application and operation were qualitatively appraised; the economic constraints were appraised (quantitatively, to the extent permitted by the data). The current state of development was assessed, identifying any technological deficiencies whose elimination might enhance applicability. (Author)

Descriptors: (*Estuaries, Mathematical models), (*Bays (Topographic features), Hydrodynamics), (*Water quality, Predictions), Diffusion, Transport properties, Mathematical prediction, Computerized simulation, Two dimensional flow, Equations of motion, Digital simulation, Computer programs, Finite difference theory.

The report documents the theory, development, verification, and application of a mathematical model which predicts the hydrodynamic and water quality behavior of well-mixed tidal rivers and estuaries. The two-dimensional hydrodynamic behavior is predicted by solving by finite difference methods the one-dimensional forms of the equations of motion and continuity applied to a two-dimensional non-uniform grid network which characterizes the prototype. This same network is utilized as the basis for predicting simultaneously the distributions of up to five conservative or non-conservative water quality constituents utilizing advective and diffusive transport mechanisms. The results of model verification and sensitivity studies are presented as well as complete documentation, including program listings, flow diagrams, input and output formats, and sample output. Identifiers: *Wellman-Lord process, *Waste gas recovery, *Air pollution control.

Discussed is the evaluation of the Wellman-Lord SO2 process for the control of SO2 from smelters. A block flow diagram was prepared. Mass and volume flow balances were estimated. Engineering estimates of the capital investment and the total annual cost (including both fixed and variable charges) were prepared. These engineering estimates were applied to previously created model gas streams and the total annual cost for each was determined. From these annual costs, incremental production costs were estimated. The technical constraints on the application and operation were qualitatively appraised; the economic constraints were appraised (quantitatively, to the extent permitted by the data). The current state of development was assessed, identifying any technological deficiencies whose elimination might enhance applicability. (Author)

INDUSTRIAL WASTE GUIDE ON THERMAL POLLUTION,
Alden G. Christianson, and Bruce A. Tichenor.
Sep 68, 121p W69-03537, FWPCA-16-30-09/68

Descriptors: (*Water pollution, Heat), (*Fishes, Water pollution), (*Fresh water biology, Water pollution), (*Marine biology, Water pollution), Industrial wastes, Reviews, Thermal power plants, Shellfish, Benthos, Algae, Aquatic plants, Cooling towers, Hydraulic models, Cooling water, Nuclear power plants, Metal industry, Chemical industry.
Identifiers: *Thermal pollution, *Water pollution damage, *Water pollution control, Cooling ponds, *Water pollution control equipment.

A guide to the sources, effects, and methods of control of thermal water pollution is presented to aid state, federal, and local regulatory personnel, community and regional planners, and industrialists in making sound decisions on handling hot discharges. A guide to more specific literature is included with a general description of the subject for the user's basic orientation. The general topics covered are heat loads from general industry, electric power, and manufacturing; physical, chemical, and biological effects; and methods of control and utilization of excess heat. A bibliography of 91 references is included. (WRSIC abstract)

GUIDELINES FOR LIMITATION OF CONTACT SULFURIC ACID PLANT EMISSIONS,
Jim Durham. Jan 71, 14p* APTD-0602

Descriptors: (*Air pollution, *Sulfur oxides), (*Chemical industry, Air pollution), (*Sulfuric acid, Air pollution), (*Sulfur dioxide, Air pollution), Recommendations, Sulfur trioxide, Contacting, Monitors, Sampling, Industrial wastes, Flue gases, Abatement.
Identifiers: *Air pollution control, *Air pollution detection.

The document was prepared to assist state and local regulatory agencies in the preparation of emission control regulations for contact sulfuric acid plants. The types and sources of air pollution in the contact sulfuric acid plant are discussed, and guidelines based on optimal use of available control technology are presented to assist agencies in developing regulations compatible with local conditions. Contact sulfuric acid plants can be designed to meet an SO2-tail-gas-emission ceiling of 6.5 lb/ton of acid produced. This is equivalent to the level attainable with both dual-absorption plants and commercially operating SO2-control processes. Appropriate equipment is commercially available and could be installed in all new and existing acid plants to reduce the acid mist emission levels to 0.5 lb/ton of acid produced. Efficient absorber operation can limit sulfur trioxide levels to 0.2 lb/ton acid produced on both new and existing installations. (Author)

Identifiers: *Mine safety, *Mine acid drainage, Water pollution control.

A systems evaluation was made to determine the engineering feasibility and probable economics of mining coal in an active deep mine in an oxygen free atmosphere using current technology in the application of life support systems to conventional coal mining techniques. A detailed investigation was conducted into the application and suitability of commercially available inert gas generators, life support clothing and equipment, and personnel communications systems. Three sites were investigated for a demonstration mine. The investigation revealed it is feasible from an engineering standpoint to mine coal in an oxygen free atmosphere. Life support and associated equipment are available essentially off-the-shelf. A deep mine using conventional mining equipment can be designed to operate in an oxygen free atmosphere. The comparative economics are extremely favorable when methane gas is recovered and sold. (Author)

Identifiers: *Muskegon County (Michigan).

The feasibility of a lagoon treatment-spray irrigation system for the combined domestic wastes and industrial wastewaters in Muskegon County, Michigan, was investigated in this study. The largest volume of industrial wastewaters are those discharged by a pulp and paper mill. Various aspects of the project were investigated including: (1) sampling and analyses of wastewaters for a variety of parameters, (2) a review of available information concerning the effect of trace elements on soils and crops, (3) laboratory tests of the treatability of the combined wastewaters by lagoon treatment, (4) development of a simulation model to assist in analyzing the volume and water quality aspects of a treated wastewater storage lagoon, (5) soils and groundwater field and office studies regarding the management of groundwater levels to ensure an adequate aerobic treatment zone in the soil as well as to prevent ponding in the site area, and (6) investigations of certain agricultural aspects in using treated wastewaters as spray irrigation water. Identifiers: *Reverse osmosis, Tertiary sewage treatment, Polyvinyl pyrrolidone.

An experimental program was carried out to evaluate potential reverse osmosis membranes for the tertiary treatment of secondary sewage effluent. The evaluation program consisted of both direct osmosis and reverse osmosis tests on various membranes using both single solutes and secondary effluent. The types of membranes tested were polyurethane latices, cellulose diacetate, cellulose 2.5-acetate, polyvinylpyrrolidone (PVP)-polyisocyanate interpolymers, and polyelectrolytes. The cellulose diacetate, polyurethane latices, and PVP

membranes were not suitable for waste-water treatment. Although rejection of most solutes by PVP membranes was quite good for dense, homogeneous membranes, high-flux, asymmetric membranes had poor rejection characteristics. Very-high flux membranes were prepared from polyacrylic acid cast onto cellulose nitrate, cellulose nitrate-cellulose acetate, and polysulfone porous supports. The best combination of high flux and rejection was obtained wtih asymmetric cellulose 2.5-acetate membranes heat-treated in water at 55 to 70C. (Author)

Descriptors: (*Water pollution, *Mine waters), (*Coal mines, Water pollution), (*Iron, *Chemical removal (Water treatment)), Surfactants, Manganese, Calcium, Magnesium, Cost estimates, Neutralizing, Limestone.
Identifiers: *Mine acid drainage, *Water pollution control, *Foam fractionation.

Basic experiments were conducted to establish the feasibility of foam fractionation in the treatment of acid coal mine drainage for the removal of the metal ions iron, calcium, manganese and magnesium. The independent variables controlling foam separation of metal ions were determined to be the concentration ratio of surfactant to iron, the air volume throughput, the foam drainage time, the total dissolved salt content and the type of surfactant used. The major part of iron, calcium, manganese and magnesium can be foam separated from acid solution by proper control of the independent variables. Reduction of residual surfactant concentration in the treated water and reduction of water entrained with the foam are two areas in need of further investigation. Foam separation was tested on acid drainage, partially lime neutralized drainage and complete limestone neutralized drainage. Tests on model solutions indicate that treatment of raw acid drainage is most feasible at present. Operating and capital costs are estimated for 0.1 and 1.0 MGD batch treatment plants. (Author)

NEUTRALIZATION OF HIGH FERRIC IRON ACID MINE DRAINAGE,
Roger C. Wilmoth, and Ronald D. Hill. Aug 70, 48p W71-04189, FWQA-14010-ETV-08/70
See also report dated May 70, PB-192 087. Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402, $0.50 as I67.13/4:14010ETV08/0.

Descriptors: (*Water pollution, *Mine waters), (*Coal mines, Water pollution), (*Neutralizing, Mine waters), (*Iron, *Chemical removal (Water treatment)), Limestone, Calcium oxides, Sodium carbonates, pH, Cost estimates, Water quality, Particles, Aeration, Pilot plants, Field tests, Sedimentation tanks.
Identifiers: *Mine acid drainage, *Water pollution control.

Lime, limestone, and soda ash were studied as neutralizing agents for treatment of a ferric iron acid mine drainage water. Both continuous flow and batch tests were used to determine the effectiveness of each of these neutralizing agents in reaction with acid mine water. Comparisons made between the three neutralizing agents include: chemical costs, reaction efficiencies, effluent water qualities, sludge settling rates, sludge volumes, and percent solids of sludges. All three neutralizing agents were capable of treating acid mine drainage. Lime costs were half that of limestone for treating the same acid mine drainage because of the low utilization of limestone. However, the characteristics of the limestone sludge were superior to those of lime and soda ash sludges. The cost for soda ash treatment was excessive. Further research on improving limestone utilization is under way. No difference in reaction efficiency were found in dry feeding or slurry feeding the neutralizing agents. Aeration during and/or after the limestone reaction merely increased the effluent pH but failed to increase limestone useage efficiency or improve effluent quality. (Author)

Identifiers: *Water pollution detection, *Water pollution effects (Plants), *Water pollution effects (Animals), Law (Jurisprudence), Pesticides, Fertilizers, Chemical industry, Phenols.

An evaluation of the water quality aspects germane to the spillage of hazardous polluting substances is developed. Emphasis is placed on definition and classification of chemical materials; the nature of the sources of spillage and past experience; and analysis of the relative threat to water quality offered by such substances; a review of presently available detection, control, and removal technology; relationship to water quality standards; and the relevant administrative, enforcement, and cost recovery aspects. Over 800 chemical substances were evaluated as to their annual production and transport quantities, their critical concentration in the aquatic environment resulting in water quality impairment for the several beneficial water uses, detection limits (both field and laboratory), and the control and removal methods presently available or potentially practicable. Over 250 chemicals and compounds, generally those in large scale production and utilization, are priority ranked in order of relative threat to water quality in terms of annual production/sales, intrinsic hazard to water quality, transport mode, and past statistical accident frequency. Recommendations are presented regarding future research and development efforts aimed at mitigating damage and a consensus of informed parties is presented relating to the need for additional legislation. Identifiers: *Kingman Lake, *Water pollution control.

This conceptual engineering study concerns the reclamation of combined sewer overflows and utilization of the reclaimed waters in a major water-oriented recreational facility for the District of Columbia. The investigation encompasses a comprehensive solution of environmental problems by proposing multi-use objectives and facilities. Principal objectives of the project included: (1) evaluation of rainfall runoff relationships for sizing of storage and treatment plant capacities; (2) confirmation of treatment feasibility using filtration and an activated carbon process; and (3) development of sufficient data for preliminary design purposes. Laboratory studies not only demonstrated process feasibility, but showed the need for including flocculation and sedimentation for removal of minute particles, together with chlorine and iodine addition for maximum disinfection. The recommended storage/treatment plan provides for a 175 million gallon storage basin, a 50 million-gallon-per-day reclamation facility and two 46-acre swimming and boating lakes. Cost effectiveness (Cost/Benefit Ratio) of the project are given. (Author)

Descriptors: (*Water consumption, Houses), (*Attitude surveys, Water consumption), (*Sewage treatment, *Houses), (*Toilet facilities, Water conservation), (*Plumbing, Water conservation), Reviews, Water quality, Septic tanks, Sanitary engineering, Osmosis, Electrodialysis, Electrolysis, Water conservation, Toilet facilities, Cost estimates.

The literature on household water quantity and quality requirements was reviewed, an average water use pattern postulated, and the amount of water used in various households functions was estimated. Comparisons of different water saving devices were made on a cost basis. Water quality is considered from three points of view: health, aesthetics, and engineering suitabil,ity. The future water demands may necessitate very strict disposal requirements and multiple water quality levels although the present standards do not tend to allow the use of several levels of water quality such as using laundering effluent for toilet flushing. Waste disposal problems of homes not connected to central sewerage systems were discussed. Septic tanks, change of phase processes, membrane processes, electrolytic processes, and other processes were evaluated, mainly on a cost basis. Most of the methods considered do not appear to be suitable for individual households at this time but with changes in economic factors and technical improvements some of these methods may be attractive for future use. A survey of homeowners, architects-engineers, plumbers and plumbing equipment manufacturers was conducted to obtain representative reactions to methods used to control water quantity and quality and waste water treatment processes. COLLECTION, REDUCTION, AND DISPOSAL OF SOLID WASTE IN HIGH-RISE MULTIFAMILY DWELLINGS.
Interim rept.
1971, 184p* EPA-SW-27C.I-71
Contract PH-86-67-167

Descriptors: (*Apartment buildings, *Refuse disposal), (*Incinerators, Refuse disposal), (*Compacting, Refuse disposal), (*Grinding (Comminution), Refuse disposal), Evaluation, Field tests, Cost estimates, Air pollution, Garbage disposal, Sanitary engineering.
Identifiers: *Solid waste disposal.

The report discusses three alternative methods of handling solid waste in high-rise multifamily housing: incineration, compaction, and wet pulverization. This interim report presents, in narrative form, the results of the first study period of the three-study-period program. Conclusions and recommendations are yet to be formulated. The report covers: (1) the objectives and scope of the project, (2) the work to be accomplished during each of the study periods, (3) the method of conducting the project, and (4) the test structures used. In addition, the existing conditions at the test structures are assessed, including the quantity and composition of the refuse, the number and age of the tenants, the contribution to air pollution by incinerators, the degree of vermin and insect infestation, the personnel and power requirements, the cost, the effectiveness and limitations, and the acceptance by owners, tenants, and custodians. The tentative data-collection program and refuse-handling equipment to be installed for the second study period are discussed. (Author)

Contract CPA-22-69-129

Descriptors: (*Air pollution, Exhaust gases), (*Aircraft engines, *Exhaust gases), Afterburning, Reciprocating engines, Combustion products, Carbon dioxide, Carbon monoxide, Hydrocarbons, Nitrogen oxides, Field tests.

The report document the exhaust emission of light, piston engine aircraft and the phenomena of natural afterburning of the exhaust gases on contact with the ambient air. The approach used in the study was to measure the exhaust emissions of representative aircraft as they were flown in a normal manner. At the same time, the extent of afterburning was measured by sampling the exhaust plume downstream of the exhaust stack and comparing the plume composition, corrected for dilution, to the composition of the stack gases. The exhaust emissions from nine light aircraft were determined using a 9-mode takeoff-cruise-landing (TCL) cycle developed for this study. Exhaust component concentrations and fuel consumption rates were measured for each mode during ten test flights per aircraft. The pollutant concentrations were converted to emission rates per pound of fuel, per minute, per mode, per TCL cycle, and per landing-takeoff (LTO) cycle. (Author)

Identifiers: *Air pollution control.

Estimates were made of the costs of controlling and reducing the emissions of selected pollutants from mobile sources within the Nation and pollutants from 23 stationary sources within 298 metropolitan areas. Under the assumed implementation plan, these estimated costs are those that will be incurred during the period of Fiscal Year 1971 through Fiscal Year 1976. In addition, an extended analysis was made to determine the economic impact of control costs on each industrial source or group of industrial sources studied. Also, the aggregate effects of the impact of individual industries upon buyer industries and consumer prices are determined. The pollutants from mobile sources selected for analysis are hydrocarbons, carbon monoxide, nitrogen oxides and particulates. The six pollutants for which control cost estimates are made for stationary sources are particulates, sulfur oxides, carbon monoxide, hydrocarbons, fluorides, and lead. Emission standards applied are considered stringent in comparison with many currently in use throughout the Nation. (Author)

Identifiers: *Air pollution detection.

The manufacture of chlorine and related products is generally known as the chlor-alkali industry. A description is given of the electrolytic process. Process information includes the discussion of normal process variables that affect the range and quantities of emissions and methods of controlling or reducing emissions. Supplemental material provides detailed emission-sampling and analytical methods. Information is provided on the range of emissions that occur under normal operating conditions and with the use of established methods and devices employed to limit or control emissions from the manufacture of chlorine and caustic. The emissions and operating data results from approximately 15 percent of present establishments, representing a broad range of plant capacities and both diaphragm and mercury cells. Most of these

data have been gathered from production records of chlorine and caustic manufacturers. (Author)

A STUDY OF NITRIFICATION AND DENITRIFICATION.
Water pollution control series,
Byron J. Mechalas, Paul H. Allen, III, and Walter W. Matyskiela. Jul 70, 105p W71-04667, FWQA-17010-DRD-07/70
Contract FWQA-14-12-498
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.00 as I67.13/4:17010DRD07/70.

Descriptors: (*Sewage treatment, *Denitration), (*Chemical removal (Sewage treatment), *Nitrates), Nutrients, Nitration, Biochemical oxygen demand, Reaction kinetics, Aerobic processes, Mathematical models, Ammonia, Oxidation.
Identifiers: Tertiary sewage treatment, Chemical oxygen demand.

A program to incorporate biological denitrification into a waste water treatment system was undertaken with the objective of developing a process that depends exclusively on the carbon compounds contained in the waste water to supply metabolic energy to the microflora. In the experimental program the incoming nitrogenous material was oxidized to nitrate in an aerobic phase and reduced to nitrogen gas in an anaerobic phase. Conditions for developing a nitrifying microflora were investigated using a primary waste water effluent as feed. Anaerobic batch experiments were carried out to determine if stored reserves could support denitrification. Under appropriate conditions almost 100% of the nitrates could be reduced. The effluent from the aerobic unit served as the feed for the anaerobic process. At appropriate intervals this situation was reversed by switching the airflows and feed sources. Over 95% of the waste water nitrogen in waste water was removed. Nitrate-nitrogen removal rates ranged from 0.600 to 1.00 mg/hr/g MLVS. A mathematical model was developed which described the response to cycled aerobic-anaerobic operation. The alternating cycle approach was shown to be an effective method for removing nitrogen from waste water. (Author)

REVERSE OSMOSIS RENOVATION OF MUNICIPAL WASTE WATER.

1971, 172p W71-04669, FWQA-17040-EFQ-12/69
Contract FWQA-14-12-184
Paper copy available from Superintendent of Documents, GPO, Washington, D.C. 20402. $1.50 as I67.13/4:17040-EFQ12/69.

Descriptors: (*Sewage treatment, *Osmosis), (*Demineralization, Sewage treatment), (*Cellulose acetate, Membranes), Chemical removal (Sewage treatment), Mathematical models, Nitrates, Phosphates, Ammonium compounds, Organic compounds.
Identifiers: *Reverse osmosis.

A fifteen-month laboratory program has shown that all grades of municipal waste water may be significantly improved by the reverse osmosis process. Comparisons are provided on the behavior and response of the reverse osmosis process to carbon-treated secondary sewage, alum-treated secondary sewage, secondary sewage, primary settled sewage, raw sewage, and digester supernatant. High removals of dissolved minerals, organic substances, and suspended matter have all been achieved in the same treatment. The effects of a flocculant, dispersant, chelating agent, enzyme, and acid on reducing product water flux decline are compared. The relative effects of reverse osmosis test-cell geometry on solids deposition and membrane performance are presented. A phenomenological model is postulated describing the role of undissolved solids and organic substances in producing product water flux decline and the subsequent maintenance of constant product water fluxes. A computer model of the reverse osmosis process has been developed to provide an accurate and rapid method of determining the design and cost of reverse osmosis facilities. (Author)

URBAN AIR POLLUTION DAMAGE FUNCTIONS: THEORY AND MEASUREMENT.
Final rept.,
Thomas D. Crocker. 1970, 116p* APTD-0631
Contract PHS-CPA-22-69-52
Appendix inserted. Prepared in cooperation with Purdue Univ., Lafayette, Ind. and Wisconsin Univ., Madison.

Descriptors: (*Air pollution, *Economic analysis), Urban areas, Damage, Present worth, Economic forecasting, Prices, Cost estimates, Land, Residential buildings, Highways.
Identifiers: *Air pollution effects (Materials).

The urban air pollution damage function as it is registered in differential market prices of residential property was investigated. By using somewhat more complex specifications and a set of data appearing to have greater informational content, the sensitivity of damage functions derived by means of differential land values to differential land values to differences in specifications and differences in data was ascertained. If results do not appear overly sensitive to data and specification differences, then simpler and less costly specifications and data sets can be used to obtain the damage function with little or no loss in information. Everything else being equal, a control instrument more likely to approach a continuing minimization of the sum of emitter control costs and receptor damage costs can then be employed. Less obtusely stated, the question being asked here is whether any additional worthwhile information about urban air pollution damage functions can be obtained by working with property value models having somewhat more complex specifications and more complete data than in previous studies. COMBINED SEWER TEMPORARY UNDERWATER STORAGE FACILITY.
Water pollution control series.

Oct 70, 89p* W71-04668, FWQA-11022-DPP-10/70
Contract DI-14-12-133
Paper copy available from Superintendent of Documents GPO, Washington, D.C. 20402. $1.75 as I67.13/4:11022-DPP-10/70.

Descriptors: (*Combined sewers, Storage tanks), (*Storage tanks, Underwater structures), (*Surface water runoff, Storage tanks), Overflows, Water pollution, Feasibility, Public opinion, Pumping stations, Steel structures, Coverings, Coated fabrics, Cost effectiveness, Maryland.
Identifiers: *Underwater storage, Cambridge (Maryland), Flexible structures.

A pilot plant underwater storage facility was designed, constructed, operated and evaluated as in a method of temporarily storing storm overflow from a combined sewer in Cambridge, Maryland. Combined sewage in excess of the sewer capacity, which would normally be discharged directly into the Choptank River, was intercepted an pumped into a nominal 200,000 gallon flexible underwater storage container located 1300 feet offshore. The stored overflow was later returned from the tank at a rate which could be accommodated by the intercepting sewer and treatment plant. The facility was tested with overflow both from four naturally occurring rainfalls and using fresh water simulation. The overflow samples were analyzed in a field laboratory for the following characteristics: pH, suspended solids, volatile suspended solids, settleable solids, 5 day biochemical oxygen demand, and chemical oxygen demand. SANTA BARBARA OIL POLLUTION, 1969.
Water pollution control series,
A. Foster, M. Neushul, A. C. Charters, and R. Zingmark. Oct 70, 56p* W71-04670, FWPCA-15080-DZR-10/70
Report on A Study of the Biological Effects of the Oil Spill which Occurred at Santa Barbara, California, in 1969. Paper copy available from Superintendent of Documents, GPO, Washington, D. C. 20402. $0.55 as I67.13/4:15080-DZR-11/70.

Descriptors: (*Water pollution, Oils), (*Marine biology, Water pollution), Aquatic plants, Ocean currents, Phaeophyta, Barnacles, Coasts, California.
Identifiers: Oil pollution, *Santa Barbara (California), *Water pollution effects (Plants).

The initial flow of oil that began on January 28, 1969, from an offshore oil platform deposited an estimated 4,500 metric tons of pollutant oil on nearly 90 kilometers of California coast by February 8, 1969. Winds, wave action, tides, and substrate determined the pattern of the oil distribution in the intertidal zone. Heavy biological damage occurred in intertidal surf grass and barnacle populations as a result of the oil pollution. Based on earlier surveys, the greatest negative biological change at a sample station was the loss of 16 plant species. However, these losses in species were attributable in most cases to sand movement and other storm-associated events. The potential long-term biological effects of the continuing pollution are discussed. This report consists of the introductory material, two short papers, and general discussions. A treatment of aspects of the Santa Barbara pollution problem that relates the authors observations to those of others, and considers the broader implications of marine pollution in general, has been incorporated in the discussion section. THE CHENA RIVER, THE STUDY OF A SUB-ARCTIC STREAM,
Paul J. Frey, Ernst W. Mueller, and Edward C. Berry. Oct 70, 109p W71-05143, FWQA-1610-10/70

Descriptors: (*Limnology, *Water pollution), (*Rivers, *Water quality), (*Arctic regions, Limnology), Benthos, Plankton, Dissolved gases, Oxygen, Water chemistry, Fisheries, Flood control, Fresh water biology, Aeration, Dams, Sewage, Freezing, Caliform bacteria, Physical properties, Streams, Alaska.
Identifiers: Chena River, Fairbanks (Alaska).

The Chena River is a subarctic stream flowing westerly from the low mountains of eastern Alaska to the Tanana River near Fairbanks. It is typical of many Interior Alaska rivers with the exception that its lower reaches are highly polluted by domestic and industrial wastes from the Fairbanks area. The purpose of this 3-year study of the river was to understand the physical, chemical, and biological limnology of the river system and what effect man's influence--past, present and future--has on the river. A flood control dam is planned for the river above the city of Fairbanks. Significant modification of the water quality and biota of the river can be expected following the construction of the dam. Proper management of the flow from the impoundment can reduce the objectionable effects of this dam on the river system. (Author)

Identifiers: *Foam fractionation.

The technical and economic feasibility of the separation of organic materials and other contaminants from primary and secondary sewage effluent by a foam fractionation-flotation process was studied. Air-waste water mixtures were held at pressures above 150 psi for from 6 to 25 minutes and then bled to a release vessel where pressures were reduced to atmospheric. Soluble organic and particulate matter collected at the bubble-water interfaces of the fine bubbles being evolved from the supersaturated liquid. Effects of varying flow rate, pressure, contact time, and of different release vessels and additives were studied. 70%, 90%, and 40-80% reductions of COD, phosphates, and suspended solids were effected at optimum conditions of air-to-water volume ratios of 2.17 to 1, pressures greater than 175 psi, and with 300-400 mg/l alum or ferric chloride as coagulants. Estimated costs, exclusive of chemicals were 5 cents/1000 gallons for a 10 mgd plant. (WRSIC abstract)

Descriptors: (*Activated carbon treatment, *Sewage treatment), (*Clarification, Sewage treatment), Particle size, Chemical removal (Sewage treatment), Coagulants, Iron chlorides, Organic compounds, Phosphates, Pilot plants, Equipment.

A comparison was made of expanded-bed and packed-bed modes of operation of activated carbon adsorption systems in the direct physicochemical treatment of raw sewage and primary effluent. The project involved extended field testing of a pilot scale treatment system of chemical clarification followed by adsorption. The expanded-bed and packed-bed modes of operation demonstrated essentially equivalent removal of organic matter from the chemically clarified effluent. When a 24 ft. settled depth of activated carbon was used, both systems consistently produced a clear, treated water with an average organic content of only 3-5 mg/l, measured either as TOC or BOD. The expanded bed mode offered several advantages: (1) it eliminates plugging or fouling with particulate matter and air binding; (2) feed pressure remains constant and maintenance requirements are minimal; and (3) it provides an opportunity for a degree of natural aeration. Estimated cost for treating raw waste water in a 10 MGD plant by this process is about 20 cents per 1000 gal. with a total estimated investment of $4,000,000. (WRSIC abstract)

ULTRAFILTRATIVE DEWATERING OF SPENT POWDERED CARBON.
Water pollution control research series,
C. W. Desaulniers, and R. W. Hausslein. Mar 70, 76p W71-05158, FWQA-17020 DBA 03/70
Paper copy available from SOD: $0.70 as I67.12/4:ORD17020DBA03/70.

Descriptors: (*Activated carbon treatment, *Filtration), (*Sewage treatment, Activated carbon treatment), (*Activated carbon, *Dewatering), Membranes, Powder (Particles), Cost estimates, Flocculants, Sedimentation, Slurries, Polyelectrolytes.
Identifiers: Ultrafiltration.

Spent powdered activated carbon from secondary effluent treatment has been successfully dewatered by continuous membrane ultrafiltration. 5 and 10% carbon solids concentration slurries, using a laboratory size thin channel (0.1 sq ft membrane area), have been dewatered by continuous ultrafiltration to solids levels of 25 to 30%. Dewatering rates ranged between 50 and 100 gal/sq ft day at transmembrane pressures of from 10 to 50 psi during runs as long as 9 days, and product water was invariably free of any suspended carbon solids. The cost of membrane ultrafiltration depends upon the membrane life, and at membrane flux rates of 50 gal/sq ft day the cost of dewatering carbon from 10 to 20% solids is $0.0015 per pound of carbon with a membrane life of six months, and $0.0035 per pound with a membrane life of only one month. At the present no conclusive data on membrane life is available, but estimates of between 1 and 6 months are quite common and seen to be reasonable. (WRSIC abstract)

DIAGNOSTIC RADIATION UTILIZATION IN SELECTED SHORT-TERM GENERAL HOSPITALS,
Fay M. Hemphill, Frances B. Locke, and Rudolph D. Hesselgren. Dec 70, 61p BRH/DBE-70-8

Descriptors: (*Radiology, Statistical analysis), (*Radiation hazards, X rays), Radiation effects, Safety, Exposure, Standards, Public health, Digestive system, Respiratory diseases, Musculoskeletal system, Isotopic labeling, Hospitals.
Identifiers: Diagnostic radiation General hospitals, Radiation exposure.

To estimate trends of diagnostic medical radiation, two million patient hospital-stay records were studied annually for 1963, 1966, and 1968 from more than 200 selected general hospitals. The data on the utilization patterns of ten diagnostic radiation categories showed a significant annual increase of discharged patients who received any diagnostic radiation, and increased utilization of multiple categories per discharge. Significant changes were found in utilization of specific radiation categories. Patterns of utilization differed markedly by age, discharge diagnosis, and hospital size. After adjustment for hospital population changes, utilization of any diagnostic radiation showed increases of 1% annually. (Author)

STATE OF THE ART REVIEW ON SLUDGE INCINERATION PRACTICE.
Water pollution Control Research series,
S. Balakrishnan, D. E. Williamson, and R. W. Okey. Apr 70, 148p W71-05384, FWQA-17070-DIV-04/70
Paper copy available from SOD $1.25 as I67.13/4:17070DIV04/0.

Descriptors: (*Sludge disposal, *Incinerators), (*Sewage treatment, Sludge disposal), Reviews, Cost estimates, Concentrating, Dewatering, Filtration, Compacting, Fuels, Furnaces, Fluidized bed processors, Oxidation, Air pollution, Hearths.
Identifiers: *Solid waste disposal.

The current status of the incineration art and the associated costs are presented. Principal emphasis is placed upon sludge thickening, sludge conditioning, sludge dewatering, sludge incineration systems, and the design and operation of incinerators. The attitudes of state agencies and consulting engineering firms towards the design and operation of incinerators is included. Conclusions reached are: (1) on-site disposal in limited space requires developments far more efficient in disposing of solids; (2) much improvement in pretreatment steps is essential; (3) addition of other combustible materials may enhance the efficiency of combustion of sludge; and (4) although several systems are currently available there is great need for investigation and updating of the process methods. Contract FWQA-14-12-568
Paper copy available from SOD $0.55 as I67.13/4:ORD-17070-EHE-07/70.

Descriptors: (*Sludge disposal, *Dewatering), (*Sewage treatment, Sludge disposal), (*Electroosmosis, Sludge disposal), Pumps, Membranes, Electrodes, Cost estimates, Zeta potential, Surfactants, Water flow.

An experimental program was conducted to determine equipment configurations for efficient solids removal, identification of critical parameters involved in the efficiency of electroosmotic pumping, and the design and testing of two prototype electroosmotic pumps. It was determined that electroosmosis can be applied to dewatering waste sludges of various types. For efficient dewatering from very wet sludge (2%) to burnable solids, it is necessary to orient the pumping apparatus with a cathode screen beneath the anode so that an initial sludge film can be formed by gravity settling at the cathode surface. Sludge cannot be thickened to a solids level exceeding 20% if the cake is beneath the liquid level of the sludge suspension and for drying beyond the 20% value, the cake must be brought out of the liquid. Paper copy available from SOD $0.75 as I67.13/4:ORD-17020-FKB-07/70.

Descriptors: (*Sewage treatment, *Activated carbon treatment), Polyelectrolytes, Activated carbon, Flocculants, Cost estimates, Water flow, Adsorption, Powders, Contactors, Slurries, Pilot plants, Field tests.

Pilot-scale studies dealing with the use of recirculating-slurry solids-contact clarifiers in treating activated sludge plant effluent were studied. Evaluation of all available materials led to selection of Darco S-51 activated powdered carbon and Purifloc C-32 polyelectrolyte flocculating agent, with 6 to 7 mg/l of polyelectrolyte required at a carbon feed rate of up to 140 mg/l. 30% greater carbon efficiency, as opposed to a single stage conventional unit, was achieved with a single slurry unit, while results for two series clarifiers were comparable to that of two conventional counter-current adsorption systems requiring multiple agitated tanks, clarifiers, and filters. Estimated costs for a 10 mgd plant with 240 mg/l and 8 mg/l dosages of carbon and polyelectrolytes respectively are $0.15/1000 gal for a 10 mgd plant, and $0.12.7/1000 gal for a 100 mgd plant. Further cost reductions could be possible in the event that effluent quality restrictions would allow a decrease in the carbon dosages. (WRSIC abstract)

Contract FWQA-14-12-113
Paper copy available from SOD $0.55 as I67.13/4:ORD-17020-FBD-03/70.

Descriptors: (*Activated carbon, *Regeneration (Engineering)), (*Fluidized bed processors, Activated carbon), Activated carbon treatment, Pilot plants, Economic analysis, Adsorption, Field tests.

Results of research conducted on the regeneration of spent powdered carbon is described. The study was directed toward the development of a fluidized-bed regeneration technique in which two systems were investigated. One was a system in which the dried spent carbon was regenerated during its passage through a fluidized-bed of inert material while the other system consisted of a pulsating fluidized-bed system in which the finely divided regenerated carbon served as the bed material. Although both systems restored the spent powdered carbon to 90% of its original adsorptive capacity and recovered 80% by weight, the fluidized inert bed was chosen for larger scale development because of its higher unit capacity. A pilot-scale unit was designed and constructed to process 30 pounds of spent carbon in an 8 hour period. The results indicated that regenerated carbon was as effective as virgin carbon for organic removal for at least 3.6 cycles through the system. As economic analysis indicated that operating costs would be about 1 cent per pound for a commercial plant producing 20,000 pounds of regenerated carbon per day. (WRSIC abstract)

Identifiers: *Solid waste disposal, Atlanta (Georgia), Columbia (South Carolina), Knoxville (Tennessee), Medford (Oregon), Pasadena (California), Waukesha County (Wisconsin).

The productive efficiency and costs associated with residential satellite vehicle collection systems are quantitatively evaluated and compared with conventional collection systems for collecting residential solid waste. Those factors that affect efficiency and economy were quantitatively analyzed to develop models that can predict collection cost and crew efficiency with a high degree of accuracy and provide a practical and reliable basis for designing future collection systems using satellite vehicles. Four makes of satellite vehicles (Cushman, Trashmobile, Westcoaster, and Trash Taxi) operating in six communities with diverse terrain, type of collection agency, and collection frequency were chosen for the study. These small three- or four-wheeled vehicles transport wastes from the dwelling unit storage point to a packer truck for ultimate transfer to a disposal site. The vehicles reportedly work best in areas with single-family homes where housing density is medium to low. The costs, which could not be compared because they occurred under distinctively different conditions, are measured as 'annual cost per dwelling' rather than as 'cost per ton.' (Author)

Identifiers: *Automobile exhaust.

The report describes the experimental results of two techniques for the removal of particulate contaminants from spark ignition engine exhausts. The first technique was based on the thermal deposition of lead aerosol particles in the size range 0.1 - 0.8 microns in a packed bed. The effect of gas-packing temperature differential, packing material, packing shape and size, contamination buildup, and gas velocity on collection efficiency of the bed was studied. Experimental results show that collection efficiency of the packed bed device depends primarily on the gas-packing temperature differential. The second technique was based on the use of sonic waves to increase the collisions between the aerosol particles and the relatively coarse particles of a fluidized bed, and hence increase the collection efficiency. The effect of sound frequency, gas velocity, and power input to the sound driver units was studied. Experimental results showed that there was no significant effect of sound frequency, in the range 250-2700 HZ, on collection efficiency of the fluidized bed. (Author)

DEVELOPMENT OF ION EXCHANGE PROCESSES FOR THE REMOVAL OF RADIONUCLIDES FROM MILK.
Final rept.,
D. G. Easterly, I. B. Brooks, J. K. Hasuike, and Charles L. Weaver. Jan 71, 45p RO/EERL-71-1
Paper copy available from SOD as EP6.10.71-1 $0.50.

Descriptors: (*Radioactive contaminants, Milk), (*Milk, *Ion exchanging), (*Food processing, Milk), Cesium 134, Iodine 131, Strontium 85, Pilot plants, Fallout.

Work has been conducted on the r[illegible]al of radionuclides from milk by ion exchar[illegible]m the late fifties to June 1969. This has prog[illegible]ed from laboratory-scale to a full-scale commercial process where the system was demonstrated to be feasible using fixed-bed ion exchange columns. For three full-scale combined anion-cation runs, an average of 99.3 percent of iodine-131 and 94.6 percent of strontium-85 was removed. This process resulted in an increase in the total solids, ash, potassium, and citrate ions. The taste of the treated milk compared favorably with untreated milk, although some decrease in flavor score was noted. Good radionuclide removal was obtained using the pilot plant moving-bed system. These studies, although not extensive, showed 89, 99, and 99.5 percent removal for strontium, iodine, and cesium, respectively. The limited investigations of cesium removal showed this system to have much greater potential than the fixed-bed system. (Author)

THE FEDERAL R AND D PLAN FOR AIR-POLLUTION CONTROL BY COMBUSTION-PROCESS MODIFICATION.
Final rept.

11 Jan 71, 352p* APTD-0643
Contract PHS-CPA-22-69-147

Descriptors: (*Air pollution, *Research management), (*Combustion, Research management), (*Combustion products, Air pollution), Fuels, Government policies, Exhaust gases, Forecasting, Gas turbine engines, External combustion engines, Internal combustion engines, Spark ignition engines, Particles, Carbon monoxide, Hydrocarbons, Nitrogen oxides, Sulfur dioxide, Furnaces, Electric power generation, Coal, Natural gas, Fuel oil, Industrial wastes, Cost estimates.
Identifiers: *Air pollution control.

The report presents the results of a study conducted for the Air Pollution Control Office to (1) identify gaps in combustion technology and (2) recommend a 5-year plan with priorities for effectively allocating resources for APCO-supported combustion R and D directed toward meeting projected needs for air pollution control of energy-conversion system by combustion modification. Combustion applications considered as elements of the plan include: central-station power generation; industrial processing; industrial steam generation, commercial and residential heating; gas turbines and external-combustion engines; and reciprocating internal-combustion engines. A 5-year plan of combustion R and D is presented, with R and D opportunities identified and ranked in five priority levels. The plan includes the description of 49 applied R and D opportunities in specific combustion application areas and 27 research opportunities of a more fundamental and broadly applicable nature. Applied R and D opportunities were ranked by a priority rationale. (APCO abstract)

CHEMICAL SPECIES IN ENGINE EXHAUST AND THEIR CONTRIBUTIONS TO EXHAUST ODOR.
Final rept. 1969-70,
Andrew Dravnieks, and Anne O'Donnell. Nov 70, 99p* IITRI-C6183-5 EPA-CPA-22-69-98
Contract PHS-CPA-22-69-98

Descriptors: (*Exhaust gases, *Odors), (*Air pollution, Exhaust gases), Diesel engines, Gas chromatography, Mass spectroscopy, Aldehydes, Alkenes, Aromatic polycyclic hydrocarbons, Ketones, Smell, Evaluation.
Identifiers: *Diesel engine exhaust, Indans.

The project investigated the chemical composition of the odorants in diesel engine exhaust. Exhaust samples were collected in fluidized or packed bed collectors filled with gas chromatographic packings. Separation of the individual compounds was accomplished by two gas chromatograph columns in series. Final identification of the separated compounds was accomplished by mass spectrometry. About 100 compounds were judged to be odor relevant in diesel engine exhaust by this procedure. (APCO abstract)

Identifiers: *Air pollution control, *Waste gas recovery, Magnesia base scrubbers.

A project was conducted to demonstrate the adequacy of magnesia base wet scrubbing to remove essentially all of the particulates and most of the sulfur dioxide from pulverized coal furnaces. Side effects such as sulfate formation, NO (x) absorption, and scrubber operability were to be determined. A wet scrubbing pilot plant which consisted of a venturi-type particulate scrubber, a venturi-type absorber, and a tray-type absorber was designed and constructed. Over 100 short term tests were performed to determine the most satisfactory operating conditions for each scrubber. The results indicate that the magnesia base wet scrubbing process is superior to other wet processes known to be under development for abatement of both particulates and SO2 from coal-fired furnaces. G. F. Grove, Jr., and E. A. Miller. Feb 71, 36p
BRH/DEP-71-3

Descriptors: (*X ray apparatus, *Radiation hazards), (*Safety engineering, X ray apparatus), X ray tubes, Spurious radiation, Mobile equipment.

Tests were performed on a Picker Model DGC-1010 capacitor discharge mobile x-ray machine to determine accuracy of voltage and current-time indications, line voltage effects and current drain, exposure reproducibility, focal spot size and location, correspondence between the collimator and light localizer, inherent filtration, half-value layer, radiation output, and tube housing and collimator leakage. Spurious radiation was found to originiate in the tube under certain conditions. These conditions were investigated, and the observed radiation levels are reported. To determine beam quality differences between capacitor discharge and conventional equipment, comparisons were made of half-value layer and step-wedge and phantom radiographs. (Author)

PLANKTON DIATOM ASSEMBLAGES IN LAKE MICHIGAN.
Water pollution control research series,
E. F. Stoermer, and J. J. Yang. Dec 69, 273p W71-05984, FWQA-18050-DKE-12/69
Paper copy available from SOD $2.00 as I67.13/4:18050DKC12/9.

Descriptors: (*Diatoms, *Lakes), (*Water pollution, *Plankton), Plants (Botany), Growth, Seasonal variations, Taxonomy, Populations, Water quality, Ecology, Food chains, Michigan.
Identifiers: *Lake Michigan.

The various elements of Lake Michigan plankton diatom flora, their seasonal cycles, and history of changes were determined and genera and species are listed. Absolute frequency, relative frequency, and contribution to diversity of each taxon were computerized. Occurrence of the different entities were recorded: those associated with certain water quality conditions; constituents of only extremely oligotrophic floras, rapidly replaced in disturbed portions of the lake; those more tolerant of changing conditions but rapidly reduced in abundance with extensive chemically measurable changes; other entities seemingly favored by slight increases in trophic level, flourishing in moderately disturbed portions of the lake, but declining when pollution increases; those formerly able to thrive only in naturally eutrophic estuaries and inshore areas, favored by increasing pollution and now flourishing in highly disturbed open lake areas; the final general group of dominant plankton species including those taxa, apparently not able to live in the original conditions of Lake Michigan but introduced following pollution. All of the plankton diatoms associated with extreme water quality degradation in the Great Lakes system are now present in Lake Michigan, indicating critical pollution levels. (WRSIC abstract)

EFFECTS OF OIL POLLUTION ON WATERFOWL; A STUDY OF SALVAGE METHODS.
Water Pollution Control Research series,
Lynn A. Griner, and Robert Herdman. Dec 70, 44p W71-05983, EPA-WQO-15080-EBZ-12/70
Paper copy available from SOD $0.50 as I67.13/4:15080EBZ.12

Descriptors: (*Water pollution, *Oils), (*Birds, Cleaning), California, Ducks, Geese, Toxicity, Cleaning, Cleaning agents, Feathers, Films, Crude oil, Petroleum industry, Pathology.
Identifiers: *Water pollution effects (Animals), Oil slicks, Santa Barbara (California), *Oil pollution.

A study was made of salvage methods for waterfowl subjected to oil pollution. Mallard ducks were the primary test species used. Aspects of the pathology of some of the waterfowl species involved in the Santa Barbara oil slicks were also investigated. Although some refined petroleum products contain toxic compounds, the Santa Barbara crude used as a test oil in this study produced no apparent ill effects. Polycomplex A-II was found to be a rapid and effective cleansing agent for the removal of oil from bird plumage. Oil on bird plumage alters feather structures by replacing the small air pockets twee fn barbules of the feather, thereby decreasing buoyancy and insulation. Removal of oil from downfeathers is more difficult than from the contour feathers. Ducks and geese are more amenable to treatment and post-treatment care than are the more aquatic fowls, such as grebes, loons, auks and murres. Confinement times should be as brief as possible, as the incidence of mycotic and other infectious diseases increases under long periods of close confinement. (Author)

Contract FWQA-14-12-181
Paper copy available from SOD $1.25 as I67.13/4:17040.05/10.

Descriptors: (*Water reclamation, *Osmosis), (*Demineralizing, Osmosis), (*Water pollution, Osmosis), (*Sewage treatment, Osmosis), Desalting, Industrial waste treatment, Water quality, Activated sludge process, Activated carbon treatment, Chlorination, Cleaning, Detergents, Field tests.
Identifiers: Reverse osmosis.

Current reverse osmosis technology was applied to the treatment and demineralization of secondary effluents to determine what operational problems may occur, and develop methods of alleviating them. Two parallel reverse osmosis systems, with 50 sq ft. spiral-wound reverse osmosis modules, were operated and results for activated sludge effluent versus activated carbon treated activated sludge effluent were compared. Fouling problems were encountered for which previously developed cleaning techniques were ineffective. An enzyme-based detergent technique was developed which alleviated the problem and restored performance. The size of the brine spacers affected only the pressure drop across the modules, and not the overall performance. Also the quantity of water handled would, over a 3 year period, be substantially more than could be handled by standard flux-high selectivity membranes. (WRSIC abstract)

EMISSION OPTIMIZATION OF HEAT ENGINE/ELECTRIC VEHICLE.
Final rept. May 70-Feb 71,
Jerar Andon, and I. R. Barpal. 28 Jan 71, 98p*
EHS-70-107

Descriptors: (*Air pollution, *Exhaust gases), (*Electric automobiles, Air pollution), (*Spark ignition engines, Exhaust gases), Hydrocarbons, Nitrogen oxides, Carbon monoxide, Acceleration (Physics), Tests.
Identifiers: *Hybrid vehicular propulsion.

The basic purpose of the study was to determine the relative reduction in exhaust emissions obtainable from a heat engine/electric hybrid vehicle when compared to the same vehicle powered by a heat engine alone. Emission measurements were made of the hybrid vehicle in its original design state as well as emission measurements of a modified and improved hybrid design. The emission evaluations were made with the vehicle in three design phases. The tests for the three hybrid designs indicated a marked reduction of exhaust emissions with the delayed throttle control and increased electrical power. The heated manifold allowed leaner air/fuel mixtures to be used and resulted in lower exhaust emissions. The best emission reductions were approximately 60% reduction in hydrocarbons and carbon monoxide and 25% reduction in nitrogen oxides when comparing the baseline heat engine with hybrid power trains. The comparisons hold for both concentration and total mass-type measurements with the vehicle on the California 7-Mode Driving Cycle. (Author)

FEASIBILITY STUDY OF REMOTE MONITORING OF GAS POLLUTANT EMISSIONS BY RAMAN SPECTROSCOPY.
Research rept.,
Donald A. Leonard. Dec 70, 52p* AERL-RR-362 APTD-0658
Contract PHS-CPA-22-69-62

Descriptors: (*Air pollution, *Monitors), (*Raman spectroscopy, Air pollution), (*Sulfur dioxide, Monitors), (*Nitrogen oxides (NO), Monitors), Flue gases, Lasers, Infrared spectrometers, Scattering, Water vapor, Oxygen, Feasibility.
Identifiers: *Laser spectroscopy, *Air pollution detection.

The feasibility of using laser Raman scattering to remotely monitor the emission of NO and SO2 from large stationary sources such as electric power plants was studied. Since no previous experimental measurement of the Raman scattering cross-sections was known to have been made for either NO or SO2, these cross-sections were measured in the laboratory using a 3371 A pulsed nitrogen laser as the Raman exciting source. Using N2 as a normalizing standard, the results are best fit by a NO to N2 Raman cross-section ratio of 0.5 + 0.1 and a SO2 to N2 Raman cross-section ratio of 2.4 plus or minus 0.3. In addition to the cross-section measurements, a field study was carried out with a laser Raman spectrometer utilizing a 3371 A pulsed nitrogen laser installed in a van at the site of large electric power plant. Raman spectra of N2, O2, H2O and CO2 were obtained from the power plant stack plume at a slant range of 625 feet without interference and detailed field procedures have been developed which permit quantitative profiles of the concentration of these molecules in the plume to be routinely obtained. However, NO and SO2 were not observed in the field study, due primarily to the insufficient stray light rejection ratio of the monchrometer used in the present system. (Author)

Identifiers: Eutrophication.

Induced air mixing of large bodies of water was investigated. The objective was to conduct a pilot-scale study to estimate the effects of variables such as the air flow rate, geometry of the body of water, energy input, size of air bubbles, and the pumping capacity of the air plume on the time of mixing. The latter was defined as the time required to reach 90% of the equilibrium concentration of the KCl tracer. In the study emphasis was put on the direction and relative magnitudes of the variables in order to obtain guidelines for large-scale investigation. Considerable time was spent on the development of the various experimental techniques. The tests were conducted in a plexiglas tank of 180 gallons capacity. It is stressed that the induced air system was investigated only from the viewpoint of its mixing performance. Its effect on aquatic life was not considered. (Author)

Identifiers: *Water pollution control.

The removal of eutrophying nutrients from wastewater effluent is of first rank priority in pollution control. One of the major problems is the removal of low concentrations of nitrogen from large volumes of water at an acceptable cost. A pilot-scale, denitrifying plant was built using two types of continuous-flow reactors, a packed column and a suspended growth chamber. Denitrification at three temperature regimes and three dissolved oxygen levels was studied as a function of the methanol:NO3-N ratio. The most efficient ratio was usually found to be between 2:1 and 3:1. Effective denitrification at lower temperatures and high dissolved oxygen content required ratios equal to or slightly greater than 3:1. (Author)

DEVELOPMENT OF PHOSPHATE-FREE HOME LAUNDRY DETERGENTS,
Karl A. Roseman, and Warner M. Linfield. Dec 70, 113p* EPA-WQO-16080-DVF, W71-06247
Contract DI-14-12-575
Paper copy available from SOD $1.00 as I67.13/4:16080DVF 12/70.

Descriptors: (*Detergents, Formulations), (*Chelating agents, Detergents), (*Surfactants, Detergents), Cleaning, Tests, Synthesis (Chemistry), Phosphates, Carboxymethyl cellulose, Alkalinity, pH control, Citrates, Sodium inorganic compounds, Abatement, Water pollution, Acetates, Sulfonates.
Identifiers: *Sodium citrates, *Acetic acid/nitrilotri, *Sodium nitrilotriacetate, *Benzene sulfonic acid/dodecyl- (sodium-salt).

Basic studies were performed towards the development of phosphate-free home laundry detergents. Five surfactants were synthesized with the idea that they might possess hard ion chelating properties. The cleaning abilities of these materials were compared to the widely used linear alkylbenzene sulfonate as incorporated into the same formulations. The detergent compositions contained 2% carboxymethylcellulose and the silicate content was varied. Sodium acetate and sodium carbonate were investigated as possible reservoirs of alkalinity. Surfactant compatibility with sodium chloride and sodium sulfate was examined. Other additives included trisodium nitrilotriacetate and sodium citrate at moderate levels. Fifteen detergent formulations were screened and the results leave little doubt that acceptable phosphate-free home laundry detergents can be developed. (Author)

Identifiers: *Plectoptera, *Mayflies, *Water pollution effects (Animals), *Mississippi River, *Hexagenia.

Three species of burrowing mayflies (Hexagenia bilineata, Hexagenia limbata, and Pentagenia vittigera) are sufficiently abundant to cause nuisance problems along portions of the Mississippi River. Mayfly distribution, as determined by collections made by ship captains and other cooperators over a 13-year period, has proven to be an excellent index of general water quality on a river which is so large that it cannot be monitored effectively or economically by standard methods. Pollutants have severely reduced the numbers of all three species for 30 miles below Minneapolis, Minnesota, and for over 300 miles below St. Louis, Missouri. Impoundment and enrichment of the Upper Mississippi River has temporarily increased the carrying capacity of the river for H. bilineata which now dominates areas formerly dominated by H. limbata. Methods have been developed to rear large numbers of Hexagenia nymphs in the laboratory. Bioassay tests utilizing artificial, burrow-containing substrates reveal that H. bilineata nymphs can survive anaerobic conditions for as long as 11 hours. (Author)

INVESTIGATION OF MEANS FOR CONTROLLED SELF-DESTRUCTION OF PESTICIDES,
Keith H. Sweeny, and James R. Fischer. Jun 70, 131p* W71-06249 EPA-WQO-16040-ELO-06/70
Contract DI-14-12-596
Paper copy available from SOD $1.25 as EP 2.10:16040ELO06/70.

Descriptors: (*DDT, *Decomposition), (*Pesticides, Decomposition), (*Chlorine organic compounds, Decomposition), Insecticides, Zinc, Coatings, Soil chemistry, Reduction (Chemistry), Catalysis, pH, Chemical removal (Water treatment), Aldrin, Chlordane, Dieldrin, Endrin, Heptachlor.
Identifiers: *Ethane/bis (chlorophenyl), Toxaphene, DDE pesticide.

Laboratory studies demonstrated the feasibility of controlled destruction of chlorinated pesticides such as DDT. The concept comprised (1) means to degrade DDT to a harmless form, and (2) methods to delay the reaction for given pest-control action. Chemical methods for degrading DDT were screened and reduction was selected as the most promising technique. Destruction of DDT, without forming DDE as a product, was demonstrated by mildly acidic reduction with zinc powder. The principal product is bis (p-chlorophenyl)ethane, DDT with all three aliphatic chlorines removed; a material stated to be 'void of the neurotoxic effects of DDT.' Catalysis of the reaction resulted in complete destruction of DDT in 1 hr at 25C and conversion to bis (chlorophenyl)ethane in 4-8 hrs. Catalyzed aluminum or iron reduction of DDT produced tetra (p-chlorophenyl)tetrachlorobutane, reportedly lipoid insoluble. Reductive degradation of dieldrin, endrin, aldrin, chlordane, heptachlor, toxaphene, and selected polychlorinated biphenyls was also shown. A 90% destruction of DDT in laboratory soil was shown in 4 days by this technique. Degradation of DDT in water was demonstrated also, a 421 mg/l suspension being reduced to 1 ppm after 1 hr reaction at 75C. Reaction delay can be achieved with wax or silyl coatings which are slowly dissolved or eroded. Coatings were produced which stopped zinc-acid reaction. (Author)

Contract DI-14-12-838
Paper copy available from SOD $1.00 as EP 2.10:14010FMH12/70.

Descriptors: (*Water pollution, *Mine waters), (*Coal mines, Water pollution), (*Oxidation, Mine waters), (*Neutralizing, Mine waters), (*Ozone, Production), Calcium oxides, Electric discharges, Economic analysis, Cost estimates, Iron inorganic compounds, Ozonization, Nuclear reactions, Chemical engineering.
Identifiers: *Water pollution control.

An engineering design and economic study to evaluate the feasibility of ozone oxidation and limestone neutralization of Acid Mine Drainage (AMD) was performed. The study concludes that an ozone process is feasible, compares economically with existing processes, and offers potential advantages in process control, reduced neutralization costs, and simplified AMD sludge handling and disposal. Ozone production by electric discharge and radiation processes are compared both for on-site and central plant installations utilizing ozone shipping and storage facilities. A central chemonuclear ozone production plant with a distribution system is found to be most economical, followed by electric discharge central and on-site plants. Design and construction of a mobile pilot plant which employs electric discharge ozonizers is recommended for field trials of the process. (Author)

INDUCED HYPOLIMNION AERATION FOR WATER QUALITY IMPROVEMENT OF POWER RELEASES.
Water pollution control research series,
Lowell E. Leach, William R. Duffer, and Curtis C. Harlin, Jr. Oct 70, 43p W71-06251, EPA-WQO-16080-10/70
Paper copy available from SOD $0.50 as EP.10:16080-10/70.

Descriptors: (*Reservoirs, *Aeration), (*Thermoclines, Reservoirs), (*Water quality, Reservoirs), Mixing, Lakes, Dissolved gases, Oxygen, Stratification, Stream flow, Sampling.
Identifiers: *Water pollution control.

Conventional hydraulic structures in most dams withdraw low flow and power releases from the poor quality hypolimnion waters during summer stratification resulting in serious degradation of long reaches of streams below dams. Induced aeration of hypolimnion waters during summer stratification has great potential in water quality management of power releases, low flow releases, and limited volumes of impoundments without costly modification of existing outlet works. Hypolimnion aeration research on power discharge quality improvement was conducted at Eufaula Reservoir in southeastern Oklahoma during the summer of 1968. Dissolved oxygen transfer efficiency of the aeration system ranged from 1.8 to 3.0 pounds of dissolved oxygen per horsepower-hour of expended energy resulting in an operating cost of 4.10 to 6.25 dollars per 1,000 pounds of oxygen incorporated into the power releases. Additional research for development and optimization of the induced aeration system is discussed. (Author)

FEASIBILITY ANALYSIS OF INCINERATOR SYSTEMS FOR RESTORATION OF OIL CONTAMINATED BEACHES,
R. M. Roberts, and T. S. Hoyt. Nov 70, 83p W71-06252, EPA-WQO-15080-DXE-11/70
Contract DI-14-12-595
Paper copy available from SOD $0.75 as I67.13/4:15080-DXE-11/70.

Descriptors: (*Beaches, *Cleaning), (*Water pollution, Oils), (*Incinerators, Sands), Coasts, Design, Combustion, Thermodynamics, Mobile equipment, Cost estimates.
Identifiers: *Oil pollution.

The feasibility of employing a combustion process for restoring oil contaminated beaches was investigated. Beach access problems and the handling characteristics of shore materials limited the potential application to recreational (sand) sites. Thermodynamic arguments required that a system design be adopted in which the contaminated sand would undergo combustive processing in a confined arrangement. The design selected, from those analyzed, proved to be a three-effect combustor based on the rotary kiln principle. Provided that the sand to be cleaned is carefully enough collected to furnish a reasonable (> or = 6%) oil content and is moved away from the surf and drained to an acceptable moisture level (> or = 6%), basic processing costs would be highly attractive. In comparison with uncontaminated sand, the cleaned product exhibits only a slightly greyish hue. (Author)

A compilation of abstracts summarizing articles from a variety of technical publications constituting the problem of urban drainage was developed by the Franklin Institute Research Laboratories. The present work includes 599 abstracts of documents published for the most part from July 1968 through June 1970. The abstracts are classed in ten sub-topic categories and arranged alphabetically by author and numerically by abstract number within each category. Each item includes a bibliographic citation, an abstract, and a set of indexing descriptors and identifiers. A cumulative subject index at the end of the volume provides the necessary access to individual concepts. An author index and journal list are also included. (WRSIC abstract)

CARBONATE BONDING OF COAL REFUSE.
Water pollution control research series,
Paul J. LaRosa, James A. Karnavas, and Eugene A. Pelczarski. Feb 71, 57p W71-06256, EPA-WQO-14010-FOA-02/71
Paper copy available from SOD $0.60 as EP 2.10:14010FOA02/71.

Descriptors: (*Coal, Waste disposal), (*Binders (Materials), Coal), (*Construction materials, Coal), (*Coal mines, *Waste disposal), Calcium carbonates, Compacting, Calcium oxides, Coatings, Water pollution, Bricks.
Identifiers: *Solid waste disposal, *Water pollution contro.

A laboratory study of the variables which affect the properties of the carbonate bonded coal refuse has been made. The carbonate bonding process utilizing coal refuse as a fill material consists of mixing coal refuse with water and lime hydrate, compacting the mixture, and reacting it with a carbon-dioxide-rich gas to form a coherent structure bonded by a matrix of calcite crystals. The resulting carbonate bonded coal refuse can be used in road building or as a coal refuse pile sealant to minimize acid mine water pollution. Four types of coal refuse were investigated--a relatively unoxidized and highly oxidized bituminous coal refuse and a relatively unoxidized and highly oxidized anthracite coal refuse. It was found that compressive strengths of 2200 to 4400 psi were obtained for the four types of coal refuse investigated using up to 12 percent lime hydrate and 9 to 15 percent water. In general, the compressive strength of the carbonate bonded coal refuse increases with increasing lime hydrate content, reaction time and carbon dioxide concentration in the carbonate bonding reaction gas. The air and water permeability of carbonate bonded coal refuse was found to be comparable to concrete. An approximate cost comparison between carbonate bonded coal refuse and other construction materials and techniques indicated that the carbonate bonding process utilizing coal refuse is the least cost means available for coal refuse pile sealing and road building. WASTE REDUCTION IN FOOD CANNING OPERATIONS: A STUDY OF FOUR METHODS TO IMPROVE THE QUALITY OR REDUCE THE QUANTITY OF EFFLUENT DISCHARGED BY A FRUIT PROCESSING PLANT.
Water pollution control research series,
Walter A. Mercer, and Walter W. Rose. Aug 70, 96p W71-06257, EPA-WQO-12060-08070
Grant WPRD-151-01-68
Paper copy available from SOD $1.00 as I67.13/4:12060-08/70.

Descriptors: (*Water pollution, *Industrial wastes), (*Food processing, *Sewage treatment), (*Canneries, *Industrial waste treatment), Fruits, Trickling filters, Water quality, Acidification, Flotation, Separators, Suspended sediments, Biochemical oxygen demand, Tomatoes, Peaches.
Identifiers: Water pollution control.

To produce the canning industry's annual nationwide pack of 760 million cases of canned foods, more than 36 billion gallons of water is required. In comparison with domestic sewage, food processing wastes are much higher in pollutional strength. Thus the research described discusses the designing of larger-scale experimentation treatment of food processing wastes. Objectives of the project were as follows: To develop information on the effectiveness of treating strong liquid wastes with a high-rate trickling filter; To evaluate under cannery conditions the effects of controlling, by the addition of edible acids, the sanitary condition of waters recirculated in product pumping and fluming systems, and to determine if the total organic waste load discharged; To determine the effectiveness of air-flotation systems for removing suspended solids; To evaluate the performance of center-discharge, fine-screen separators in removing suspended solids; and To select, on the basis of results obtained, a system or systems to be enlarged in scale. Paper copy available from SOD $1.25 as I67.13/4:12040-EBY-08/70.

Descriptors: (*Water pollution, *Spent liquors (Pulping)), (*Paper industry, Water pollution), (*Aerial photography, Water pollution), Kraft paper, Sulfate pulps, Pacific Ocean, Detection, Sampling, Computer programs, Mixing, Concentration (Composition), Coasts, Remote sensing.
Identifiers: *Water pollution detection.

Aerial photography taken of waste plumes from Kraft pulp mill ocean outfalls was shown to be an effective tool in the study of waste disposal sites. This technique is not limited by sea conditions and permits monitoring and evaluation of outfall sites throughout the year. Photography taken at one instant provides comprehensive information throughout the waste field. Manpower requirements and costs for this method are considerably less than for conventional boat sampling surveys. Field studies were conducted on the waste plumes from Kraft pulp mill ocean outfalls at Newport and Gardiner, Oregon and Samoa, California. Waste concentrations were measured by conventional boat sampling techniques while aerial photography was taken of the outfall area from altitudes ranging from 3,000 to 11,000 ft. Computerized procedures were used to compute water currents, waste concentrations, toxicity zones and diffusion coefficients from the photography. The maximum concentration determined over the outfall for each field study was generally less than that shown to have a detrimental effect on young salmon for a 14-day exposure. Surface water current was found to be the dominant factor in the resulting plume pattern. During periods of low current velocities in the receiving water, the hydraulic head created by the effluent source was a significant factor in the resulting plume shape. The steady state form of the Fickian diffusion equation and unidirectional transport velocity was not applicable to the majority of the observations. (Author)

X-RAY FLUOROSCOPIC SCREENS-HISTORY, CRYSTAL KINETICS, PRELIMINARY REPORT ON AGING,
William S. Properzio, and Dale Trout. Feb 71, 61p BRH-DMRE-71-2
Paper copy available from SOD as HE20.1516:71-2 $0.60.

Descriptors: (*Fluoroscopes, Fluoroescent screens), (*Fluorescent screens, Aging (Materials)), Radiation damage, Deterioration, Phosphorescent materials, Crystals, Scintillation.

A preliminary report is made on a long-range study of the factors which reduce the light output of fluoroscopic screens. New screens are being exposed to x-rays, sunlight, incandescent lamps and fluorescent lamps. The light output of these screens is measured monthly. Comparative measurements are also being made on older screens. These measurements indicate that the new phosphors and technological advances over a 40-year period have enabled a decrease in patient exposure by a factor of eight to ten. Based on the study results, it is recommended that all fluoroscopic screens made before 1947 should be replaced with screens incorporating the new phosphors and technological advances. (Author)

A RADIATION SURVEY OF TELEVISION REPAIR SHOPS IN THE BALTIMORE AREA,
John L. Wyatt, Jr., and Thomas M. Moore. Mar 71, 49p BRH/DEP 71-4
Paper copy available from SOD $0.50/copy, HE20.1513:71-4.

Descriptors: (*Radiation hazards, *Repair shops), (*Maintenance personnel, Radiation hazards), (*Television receivers, Radiation hazards), Color television, Color television tubes, Electronic technicians, Surveys, X rays.
Identifiers: *Television repair shops, Baltimore (Maryland).

A pilot study of the radiation exposure to television repair technicians during the course of their work was performed in 70 Baltimore-area television repair shops from March to October 1970. In the first 25 shops, personnel dosimeters were distributed to the repair technicians, and radiation exposure measurements were made on 58 color television receivers representing 15 different brands. In the remaining shops, no radiation measurements were made on receivers, but dosimeters were distributed to the technicians to enlarge the statistical base for personnel exposure determinations. The survey data indicated that the radiation doses received by the technicians were relatively low. Hence, it was concluded that a national survey does not appear necessary. (Author)

TECHNOLOGICAL AND ECONOMIC FEASIBILITY OF ADVANCED POWER CYCLES AND METHODS OF PRODUCING NONPOLLUTING FUELS FOR UTILITY POWER STATIONS.
Final rept. 1 Jul 69-31 Dec 70,
F. L. Robson, A. J. Giramonti, G. P. Lewis, and G. Gruber. Dec 70, 569p* UARL-J970855-13 APTD-0661
Contract CPA-22-69-114

Descriptors: (*Air pollution, *Sulfur dioxide), (*Electric power plants, Air pollution), (*Desulfurization, *Fossil fuels), (*Coal, Desulfuri

tion), Steam electric power generation, Electric power generation, Gas turbine power generation, Operating costs, Engineering drawings, Economic analysis, Petroleum.
Identifiers: COGAS power system.

Analytical studies have been made to identify the technical and economic factor that will govern future selection of fuel cleanup processes and advanced-cycle central power stations which, in combination, will be capable of producing electric power at the lowest possible cost while reducing substantially the emissions of sulfur oxide pollutants resulting from the combustion of high-sulfur coal and residual fuel oil. The technical approach was based upon technology currently available, but possibly not reduced to commercial practice as well as technology judged attainable for commercial use within the next ten and twenty years. This approach included evaluations of current and projected; fossil-fuel desulfurization and conversion processes, current and advanced-cycle central power stations, and integrated fuel cleanup and power stations. EVALUATION OF LITHIUM FLUORIDE FOR MICROWAVE DOSIMETRY APPLICATIONS.
Technical rept.,
David L. Conover. Apr 71, 29p BRH/DEP-71-6

Descriptors: (*Lithium fluorides, *Luminescent dosimeters), (*Thermoluminescence, Lithium fluorides), Chemical dosimeters, Microwaves.
Identifiers: Microwave dosimeters.

The use of LiF thermoluminescent dosimetry (TLD) material as a dosimeter for microwave radiation was evaluated. Teflon discs impregnated with LiF were subjected to saturation exposures (approximately 100,000 R) of gamma radiation, and these irradiated dosimeters were exposed to microwave radiation at 2450 MHz. Analysis of the relative light output data for the treatment groups indicated that there were no significant differences between groups. Hence, it was concluded that LiF, as used in the study, will not serve as a useful dosimeter for microwave radiation in the 2450-MHz frequency band. (Author)

Identifiers: *Waste gas recovery, *Claus process, *Air pollution control.

The report is Volume I of a two-volume report which summarizes the results and conclusions of a study of SO2 reduction processes. Volume I covers phase I activities, with the aim of establishing the state-of-the-art of reduction to sulfur techniques. Based on a comprehensive literature survey, thirty case studies were worked up covering several types of sulfur oxide stack emissions and several reductants. Each case was based on the best information available, and use of updated technology in devising the process sequence. Flow sheets, operating parameters and economics are reported in the report. CHARACTERIZATION AND CONTROL OF GASEOUS EMISSIONS FROM COAL-FIRED FLUIDIZED-BED BOILERS.
Interim rept.,
E. B. Robison, A. H. Bagnulo, J. W. Bishop, and S. Ehrlich. Oct 70, 239p* APTD-0655

Descriptors: (*Air pollution, *Combustion products), (*Coal, Air pollution), (*Furnaces, Air pollution), (*Adsorbents, *Limestone), (*Sulfur dioxide, *Adsorption), Fluidized bed processors, Particles, Nitrogen dioxide, Pilot plants, Hydrocarbons, Fly ash, Tests, Boilers, Injection, Cost estimates.
Identifiers: *Air pollution control.

Results are presented from a test program to characterize the air pollution emissions from the combustion of coal in a fluidized bed combustion and to assess the potential of fluidized-bed combustion for air pollution control. These emissions were monitored under a comparatively large number of different conditions. Efforts were made to reduce emissions of oxides of sulfur by the use of limestone-based sorbents and to determine the conditions most favorable for the reduction. Emis-

sions of sulfur dioxide, nitric oxide and hydrocarbon were monitored continuously with periodic samples taken for measurement of particulates and wet test determination of SO (x) and NO (x). When conditions most favorable for air pollution control were established on a pilot scale, the conditions were reproduced in tests with the fluidized-bed boiler module. (Author)

SILICATE TREATMENT FOR ACID MINE DRAINAGE PREVENTION, SILICATE AND ALUMINA/SILICA GEL TREATMENT OF COAL REFUSE FOR THE PREVENTION OF ACID MINE DRAINAGE.

Feb 71, 100p W71-07052, EPA-WQO-14010-DLI-02/71
Contract DI-14-12-560
Paper copy available from SOD $1.00 as EP2.10:14010DLI02/71.

Descriptors: (*Water pollution, *Mine waters), (*Coal mines, Water pollution), Neutralization, Coatings, Refuse, Surface water runoff, Gels, Sodium silicates, Weathering, Rubble.
Identifiers: *Mine acid drainage, *Water pollution control, *Coal mine refuse.

A treatment technique has been demonstrated on a laboratory scale which inhibits or prevents the generation of acid mine water from waste coal refuse. Three variations of the general method were considered: Neutralization of the water-accessible refuse with a dilute solution of sodium silicate (waterglass); development of a continuous gel on the refuse surface structure which sealed off the entire pile from natural runoff waters; development within the pile structure of a continuous silica/aluminia gel to eliminate percolation through the refuse and minimize the effect of natural erosion of the gel structure. Comparison of the effluent water with an untreated pile shows that the neutralized pile was effective for a minimum of 120 in. of equivalent rainfall in inhibiting AMD generation. The surface gel was effective for a longer period of time. The most effective treatment utilized a mixed alumina/silica gel formed within the pile at depths up to 6 in. This method was effective for more than 500 in. of equivalent rainfall, the duration of the test, and appeared to be exceptionally stable at that time. The weathering resistance of the treatment methods was evaluated by heating the gel treated refuse in the laboratory and exposing it to rain, snow, and freeze-thaw cycles outdoors. (Author)

TECHNICAL-ECONOMIC EVALUATION OF AIR-POLLUTION CORROSION COSTS ON METALS IN THE U.S.
Final rept.,
F. W. Fink, F. H. Buttner, and W. K. Boyd. 19 Feb 71, 160p* APTD-0654
Contract CPA-70-86

Descriptors: (*Air pollution, *Corrosion), (*Economic analysis, Air pollution), Cost estimates, Corrosion prevention, Maintenance, Steels, Storage tanks, Bridges (Structures), Power transformers, Street lighting, Fences, Wire rope, Sulfur dioxide, Siding, Aluminum, Economic forecasting, Trends.
Identifiers: *Air pollution effects (Materials).

A study was conducted to provide an estimate of the cost to the nation's economy resulting from the corrosion damage to metals by exposure to polluted air. More specifically the major objectives may be stated as follows: Assess the total economic loss to the nation in dollars resulting from the increased corrosion damage of externally exposed structures or systems caused by the presence of man-made pollutants in the atmosphere; and Establish from predicted changes in population, industrial activity, technology of pollution control, corrosion prevention, external structures, and air pollution regulation on the probable size of this economic loss in 1980. A COMPARATIVE ANALYSIS OF THE RELATIONSHIP BETWEEN MORTALITY AND AIR POLLUTION AND WEATHER. I. UTILIZING MULTIPLE REGRESSION ANALYSIS.
Final rept.,
John R. McCarroll, and Michael D. Lebowitz. Jun 65, 27p APTD-0650
Contract CPA-22-69-126
See also Part 2, PB-198 516.

Descriptors: (*Air pollution, *Mortality rates), (*Weather, Mortality rates), (*Public health, Air pollution), Urban areas, Application of mathematics, Correlation, Regression analysis.

Multiple regression analysis, with lags, was performed on daily mortality on air pollution and weather variables for three United States cities (New York, Philadelphia, Los Angeles). Relationships between mortality and air pollution weather were found for all three cities. These relationships were consistent within cities, by season. They were also consistent between cities, allowing for generalization about the relationship: daily mortality is associated with air pollution and weather in urban areas of the U. S. This association can be stated as a formal relationship in time. The effect of pollution and weather on mortality is essentially an immediate one. (Author)

A COMPARATIVE ANALYSIS OF THE RELATIONSHIP BETWEEN MORTALITY AND AIR POLLUTION AND WEATHER. II. THE STIMULUS. RESPONSE METHOD OF ANALYSIS AND RESULTS,
James McCarroll, and Michael D. Lebowitz. Jun 65, 19p APTD-0651
Contract CPA-22-69-126
See also Part I, PB-198 515.

Descriptors: (*Air pollution, *Mortality rates), (*Weather, Mortality rates), (*Public health, Air pollution), Correlation, Applications of mathematics, Stimulation, Environment, Responses, Models, Urban areas.

This study is a further attempt to find a relationship between daily mortality, air pollution, and weather. New methods were devised for this purpose. The study was comparative. Three U.S. Cities were studied at the same time using the same methods and similar data from each. Due to the insufficient models previously used to study the relationship between mortality and air pollution and weather, a new model was conceptualized. This model, the stimulus-response model, serves as the frame work for extensive analysis of the relationship. The analysis was performed on data from New York City, Philadelphia and Los Angeles. The data included total daily mortality, 65 plus mortality, pollutants and weather. (Author)

Grant FWPCA-14010-FII
Paper copy available from SOD $0.50 as EP 2.10:14010F1103/71.

Descriptors: (*Pyrite, *Oxidation), (*Mossbauer effect, Pyrite), (*Water pollution, *Mine waters), Iron ores, Sulfide minerals, Iron sulfides, Coal mines, Surface chemistry, Iron sulfate, Hydroxides.
Identifiers: *Mine acid drainage.

Laboratory studies demonstrated the feasibility of using the Mossbauer effect and a backscattering mode of detecting 14.4 Kev gamma rays to spectroscopically monitor the oxidation processes taking place on pyrite materials. A cobaltous oxide form of cobalt-57 was the radiation source. Spectra were obtained of pyritic surfaces under 2 mm of water. Differentiation of nonoxidized and oxidized pyritic surfaces was possible with further separation of the spectra to show individual oxidation product peaks suggesting ferric hydroxide and ferric sulfate. THE BIOCHEMISTRY OF ANAEROBIC DIGESTION.
Final rept.,
John S. Jeris, Yi-shon Chen, Tse-Wen Chi, Yi-siung Su, and Cheng-nan Weng. Feb 70, 148p* W71-07136, EPA-WQO-17070-DFK-02/70

Descriptors: (*Anaerobic processes, *Metabolism), (*Sewage treatment, Anaerobic processes), (*Digestion (Decomposition), Anaerobic processes), Microorganisms, Methane, Biochemistry, Labeled substances, Lactic acid, Propionic acid, Succinic acid, Benzoic acids, Oleic acids, Digesters.

The investigation sought to determine by means of radioactive tracer techniques, the biochemical mechanisms in the anaerobic degradation of typical organics found in wastes. Two liter laboratory scale digesters were used in all the radioactive

tracer work. Substrate and nutrients were slug fed daily while carbon-14 compounds were slug fed one time or daily depending on the type of study being performed. Chemical analyses of the liquid feed and effluent were routinely performed along with identification of gaseous end products. Radioactivity analyses on the gases produced were conducted using liquid scintillation techniques. The degradation of propionic, succinic and lactic acids appear to be closely related with common intermediates. Propionic acids can be degraded through lactic or succinic acids and the reverse is true for each of the other two compounds. Propionic acid may also be metabolized by alpha or beta-oxidation giving rise to an intact methyl group in the methane formed, from either the number two or three carbon. A pathway for glutamic acid utilization was postulated involving the formation of two moles of acetic acid for each mole of substrate used. Oleic acid was primarily degraded by beta-oxidation. In the fermentation of benzoic acid, three moles of acetic acid were produced per mole degraded. (Author)

Descriptors: (*Air pollution, *Smog), Aerosols, California, Sampling, Chemical analysis, Monitors, Atmospheric condensation, Particle size, Turbidity, Condensation nuclei, Gas sampling, Urban areas.
Identifiers: *Los Angeles (California), *Air pollution detection.

A collaborative research study on the physical and chemical properties of Los Angeles smog aerosol was undertaken by a group of investigators. One of the prime goals of the study was to carry out a comprehensive, collaborative, effort, using a sufficient variety of chemical and aerosol measurement techniques on the same aerosol at the same place at the same time, so that a significant im-

provement in the correlations between various measurements could be made. The experiments were divided into the following main categories: (1) Measurement of the number versus size spectra measurements using the automated Minnesota Aerosol Analyzing System, (2) Sampling of the aerosol by lundgren impactor for mass and chemical composition versus size distribution, (3) Continuous gas analyzers, (4) Turbidimetric measurements, (5) Miscellaneous experiments including: cloud condensation and ice nuclei, samples for electron microscope and single particle chemicalanalysis, humidity effects, smog making in a bag, smog coagulation in a bag and particle beam experiments.

Identifiers: Air pollution control.

A final report of a study which was conducted with the objectives of estimating the present and future availability of residual fuel oil (RFO), relative to the U.S. Market, at current high sulfur levels and at low sulfur levels. The study consisted of two phases, as follows: Phase 1 - compilation of statistical data relating to the recent history of the crude oil and residual fuel oil situation throughout the world with particular emphasis on the United States. Phase 2 - Estimation of the present and future production capability of existing refineries, which are engaged in supplying the U.S. residual fuel oil requirements. Projection of the RFO production capabilities of these same refineries after the addition of hydrotreating facilities and the incremental cost of producing low sulfur RFO as a result of such modifications. Identifiers: *Air pollution control, *Waste gas recovery.

An experimental study was conducted on a fluidized bed coal combustion system using lime as a bed material. The lime reacts with SO2 and O to form CaSO4 under oxidizing conditions, thus reducing SO2 emissions. The reductive regeneration of the sulfated lime back to CaO2 and recycle of the regenerated lime back to the combustor was investigated as a method of reducing fresh limestone feed rates to the system. A three inch diameter combustor and a two inch diameter were utilized in this experimental program. (Author)

ENVIRONMENTAL LEAD AND PUBLIC HEALTH.
R. E. Engel, D. I. Hammer, R. J. M. Horton, N. M. Lane, and L. A. Plumlee. Mar 71, 39p AP-90
Paper copy available from GPO $0.25 as EP4.9:90.

Descriptors: (*Lead poisoning, *Public health), (*Air pollution, Lead poisoning), (*Food contamination, Lead poisoning), (*Occupational diseases, Lead poisoning), Lead (Metal), Toxicology, Children, Diets, Metabolism, Paints, Residential buildings.

This document proposes to summarize briefly the major public health problems associated with lead in the environment. A basic discussion of lead metabolism and toxicology is presented, followed by sections on diet and consumer goods and on ambient air, all of which deal primarily with general population exposures. Because industrial workers and children constitute two distinct exposure groups, they are disconstitute two distinct exposure groups, they are discussed in separate sections. (APCO abstract)

Identifiers: *Reverse osmosis desalination.

The three major configurations of reverse osmosis units include spiral wound units, tabular units, and plate and frame units. Tests were conducted on prototype units employing all three configurations, and the membranes were found capable of rejecting 93 to 95% of TDS, 90 to 99% of phosphates, 80 to 90% of ammonia nitrogen, 60 to 70% of nitrate nitrogen, 99 to 100% of particulate matter, 90 to 95% of TOC and greater than 90% of COD. Many of the problems discovered stemmed from the use of prototype units which had not been thoroughly tested and were subjected to repeated mechanical failures. Fouling problems have been partially alleviated by periodically depressurizing the membranes and washing them with enzyme detergents. The success of this method is attributed to protein hydrolysis of the slime layer which coats the membrane. Increasing population has dictated the recycling of a much larger portion of the nation's water. Each time it is re-used, the water picks up greater amounts of dissolved solids. These solids will eventually have to be removed to preserve the potability of drinking water. Also, increasing advances in membrane materials have steadily decreased the cost of reverse osmosis to the point that a reverse osmosis system coupled with primary and sand filtration only has an estimated cost of 35.4 cents/1000 gallons. Identifiers: *Water pollution control.

The basic objective of the studies was to find a technically feasible and economical procedure for treating the wastes from a sole weather vegetable tannery. A detailed identification of the sources of all wastes as well as a comprehensive characterization of each waste fraction was made. It was found that a large percentage of the pollutants initially were contained in a relatively small fraction of the total waste volume. The treatment scheme consisted of separation and pretreatment of the individual waste streams followed by mixing all waste streams for additional treatment in an anaerobic-aerobic lagoon system. The lime bearing wastes from the beamhouse were screened, treated with polyelectrolytes, and then clarified. The lime sludge was used for landfill. The system was designed to treat one million gallons of waste per week. BOD was reduced 85-95 percent and the suspended solids reduction was in excess of 95 percent. Installed cost of the total system was approximately $40,000 and it is estimated that the operating cost will be about $15,000 per year or 7 cents per hide processed. (Author)

Identifiers: *Water pollution control.

Fiber glass production involves the use of an expensive phenolic resin. A 28 month study was conducted to determine the feasibility of reclaiming

waters which had been used for washing resins off of conveyor lines to prevent fouling. The system developed reduces water consumption by utilizing an 8 gpm, 1000 psi spray cleaner. After the conveyors are washed, the water flows through two stages of screening, or primary filtration, and a secondary diatomite filtration unit. Since most of the solids are large, the diatomite filters accomplish the removal of only .6% of the total solids load, with the major removals taking place at the pre-screening equipment. The water re-use system will use the same water 4.5 times before it is completely evaporated, requiring 1 lb of diatomite/500 gallons of water filtered. The system provides water at a net cost of $.37/1000 gallons as compared to $.75/1000 gallons for city water. Substantial operational savings have been realized through conservation of the expensive phenolic binder. Waste phenolic discharges have dropped 80%, suspended solids have decreased 85%, and dissolved solids have decreased by 50%. In this instance, therefore, waste discharge control has both protected the environment and profited the industry. (WRS abstract)

CANNERY WASTE TREATMENT KEHR ACTIVATED SLUDGE.
Water pollution control research series,
Robert A. Fisher. Sep 70, 70p W71-07757,
FWQA-12060-EZP-09/70
Paper copy available from GPO $0.70 - 167.13/4:12060-EZP-09/70.

Descriptors: (*Activated sludge process, *Industrial waste treatment), (*Sewage treatment, Activated sludge process), (*Canneries, Industrial waste treatment), Aeration, Biochemical oxygen demand, Particles, Tests.
Identifiers: *Kerr activated sludge process.

The Kehr modification of the activated sludge process (KASP) uses completely mixed aeration tank with no intentional solids wasting. After the aeration tank stabilized at between 4000 and 12,000 mg/l of MLSS, a 40 day investigation using municipal and cannery wastes of strengths from 200 to 2000 mg/l BOD5 was conducted. 90% BOD5 and 80% TOC reductions were achieved, but little or no reduction was detected in nitrates and phosphates and the effluent was colored and turbid. Periods of little or no loading for as long as 48 hours caused no decrease in treatment efficiency when flow was resumed. From the above information, KASP was recognized as being well suited to industrial waste pre-treatment prior to discharge to a municipal treatment plant. The ability to handle intermittent flows provide 90% BOD5 removal, and provide aerobic digestion of solids in the aeration tank is essential for pre-treatment devices and all are possessed by KASP. Exclusive of primarytreatment, treatment of 10 mgd of a 250 mg/l BOD5 waste would cost 7 cents/1000 gallons using gravity settling. (Author)

Identifiers: *Water pollution control.

Biological uptake, chemical precipitation of soluble phosphorus, and settling or filtration of particulate phosphorus are the major removal mechanisms used in phosphorus removal. At present, chemical precipitation is the most universally applied method. The wide variety of chemical reactions which lead to phosphorus precipitation allows much flexibility of operation to plant operators. In dealing with raw sewage, primary effluent, or secondary effluent the size of the plant, influent waste water characteristics phosphorus discharge standard, and the types of other processes used in the treatment train must all be considered. In addition to phosphorus removal, higher levels of BOD and suspended solids removals are customarily are customarily obtained when some type of phosphate reduction mechanism is employed. Each of the mechanisms described here have been analyzed both with respect to technological and economic feasibility. Costs ranged from 13 cents/1000 gallons for two-stage lime treatment of 1 mgd to achieve 97% removal, to a potential low of $.015/1000 gallons using waste pickle liquor to achieve a reduction of 80%. Identifiers: *Eutrophication.

This study considered the receiving stream as an integral part of the bio-oxidation pond method of treatment with the objective being to provide a better understanding of the bio-oxidation pond - receiving stream system. As representative of this 'real world' situation with all of its variables, five existing central Oklahoma bio-oxidation ponds which had diverse loadings and designs were utilized. By observing these systems under varying climatic conditions, the effects of the bio-oxidation pond nutrients along with other pollutional parameters which were discharged into intermittent receiving streams were evaluated. Except for scouring, bio-oxidation ponds and bio-oxidation pond - receiving streams were found to behave essentially the same as the streams became a continuation of the pond. In addition to making biochemical adjustments, the streams lost much of their biological identity and assumed characteristics more closely associated with the biological loadings from the pond effluent. The most persistent algae in the systems were the flagellates (Euglenophyta) and the blue-green algae (Cyanophyta) as these plankters had little difficulty making the transition from their acclimated life in the pond to the stream. Identifiers: *Ecosystem of Machines Information System, EMIS (Ecosystem of Machines Information System).

The report attempts to reveal the alternatives available to government and to private industry as they cope with the conflict of economic growth and pollution abatement. In relating the multifaceted approaches to the problem, the report has two purposes: To minimize the conflict between economic growth and pollution abatement by examining opportunities which are often overlooked; To create an information system which clearly identifies the empirical possibilities available within the pollution abatement strategies considered. This approach, which is called, Ecosystem of Machines Information System (EMIS), suggests a way of determining the minimum data needed by integrating data sets with abatement strategy; a way to maximize useful information by collecting data in the context of its use, and a systematic way to judge alternative approaches for particular industries in a decentralized economy. Presented is the design for the systematic identification of potential matches of industries, listing the basic computer routines. A sample data base is indicated and processed through the alternative strategies for abatement. The present practices of abatement policy are investigated and opportunities through the EMIS method are suggested. Twelve reasons why this approach will not work and 12 requirements which are raised by these objectives. (Author)

NEW TECHNOLOGY FOR TREATMENT OF WASTEWATER BY REVERSE OSMOSIS.

Sep 70, 77p W71-07990 EPA-WQO,-17020-DUD-09/70
Contract EPA-WQO-14-12-553
Paper copy available from GPO $0.70 as EP2.10:17020DUD09/70.

Descriptors: (*Sewage treatment, *Osmosis), (*Membranes, Osmosis), (*Demineralizing, Membranes), (*Cellulosic resins, Membranes), Fabrication, Desalting, Cleaning, Flux (Rate), Fouling, Dissolved gases, Ammonium compounds, Particles, Cellulose acetate, Colloids, Succinates, Fluid flow, Sulfates, Enzymes, Casting, Semi permeability.
Identifiers: *Reverse osmosis.

Stable, high-flux membranes for wastewater renovation by reverse osmosis were required to meet or exceed: fluxes greater than 60 gal/sq ft/day with no more than a 20% increase after one year; Rejection of 60% of sodium chloride; and Rejection of 90% of sodium sulfate. All testing was performed at 600 psi, with 1000 ppm feed solutions. These specifications were met by three cellulose based membranes. Flux losses over short periods were extrapolated to yearly values and ranged from 12-18%. However, periodic cleaning with a laundry enzyme pre-soak was necessary as the flux rates initially declined very rapidly. Cleaning restored the membranes to 80 to 90% of the initial values. Daily cleaning maintained a five day series of tests at nearly constant levels. The best of the three membranes tested rejected 90 to 97% of TDS, 70 to 100% of COD, 86 to 96% of ammonium ion, 72 to 99% of nitrate ion, and 97 to 99% of total phosphate. Techniques were explored for attachment of proteolytic enzymes to cellulose acetate membranes to render them resistant to colloid fouling. The proteolytic enzyme trypsin was chemically attached to the active layer surface of a membrane prepared from the N-hydroxysuccinimide ester of cellulose acetate hydrogen succinate. The resulting enzymatic membrane displayed hydrolytic activity. No cost estimates were presented for this type of treatment process. (WRSIC abstract)

Identifiers: *Water pollution control.

High levels of phosphorus removal have been observed at the Baltimore Sewage Plant in the past. A six month study of the operating conditions and design parameters of tow parallel, 10 MGD activated sludge systems was conducted in an attempt to establish the mechanism by which the phosphate was removed. The following variables were used: suspended solids concentration, waste water flow, aeration basin mixing configuration, and dissolved oxygen levels. Both mixing and dissolved oxygen were shown to influence the process greatly. Contact stabilization or step aeration, as opposed to plug flow, caused sharp decreases in the removals, while low dissolved oxygen levels stimulated releases of phosphorus from the sludge. Operating conditions which enhance phosphate removal are standard conditions now at the Baltimore plant. Phosphate removal at Baltimore average 82%, compared with 15 to 20% removals for conventional activated sludge, and 9% in Baltimore's trickling filter. No cost analysis was undertaken, wince complete removal of the phosphorus involves removal from the sludge supernatant. Some of the parameters which may lead to enhanced phosphate removals have been demonstrated. However, the exact reaction or mechanism by which the removals proceed is still unknown, even though it was established that the calcium removed from the system was not principally by precipitation. Identifiers: Thermal pollution.

A system of outdoor experimental ponds for the study of aquatic life under the effect of various controlled water temperatures has been designed. The ponds were to be located near power plants in Minnesota. The purpose of the study is to determine the feasiblity of maintaining certain specified temperature regimes in the proposed ponds. This was done by considering the available heating and cooling capacity and the environmental conditions prevailing at the selected site and making design calculations for the major elements of the system. Firstly, the limits of feasible temperature control were determined. Secondly, heating and cooling systems were devised and thirdly, a method of control was developed. For cooling, use of the well water is proposed, and, for heating, the water released from the thermal power station is going to be used. External and internal heat exchange systems were examined and both were found to be feasible and adequate. The study has the character of a feasibility study. (WRSIC abstract)

Identifiers: Radiometric thermasondes.

The problem of determining the height of the base, the intensity and the thickness of an elevated inversion layer from radiometric thermasonde data is discussed. Three advanced radiometric data analysis techniques emphasizing the detection and measurement of these salient features of elevated inversions are proposed. The techniques include: (1) a statistical procedure for finding the best three-straight-line representation of the true profile from the radiometric data--called the gradient altitude model, (2) a relaxation procedure for finding the ambient temperature at sixteen preselected heights from the surface to 2.54 km, and (3) several analog and empirical techniques for detecting the presence and determining the base heights and other features of an elevated inversion directly from the recorder outputs of thermasonde data. The initial development and evaluation of these techniques using simulated and real data are presented. The results show that the problem of determining the features of an elevated inversion becomes more difficult as the height of its base in-

creases, its intensity decreases, and its thickness decreases. The relaxation technique appears to be capable of providing accurate descriptions of the temperature profile in the case of elevated inversions of up to 5. (Author)

CHEMICAL CHARACTERISTICS OF ORGANIC COLOR IN WATER.
Final rept.,
Russell f. Cristman, Mesahisa Nakamura, and Warren Williams. Sep 70, 95p W71-08396, FWQA-16020-DKW-09/70

Descriptors: (*Water pollution, *Colors (Materials)), (*Chemical removal (Water treatment), Colors (Materials)), (*Coagulation, Chemical removal (Water treatment)), Precipitation (Chemistry), Colloids, pH, Organic compounds, Aluminum inorganic compounds, Thorium inorganic compounds, Lanthanum compounds, Computer programs, Carbon, Electrochemistry, Chemical equilibrium, Adsorption.

The colloid charge titration technique described by Kawamura and Tanaka, was used to measure the charge on color-aluminum, color-thorium, and color-lanthanum dispersions. This method was able to measure the charge on colloids which were too small to be seen, thus replacing the Briggs microelectrophoresis cell technique. Tests were conducted using a Lumetron Model 402E filter photometer to obtain data points of pH vs % transmission; and pH vs total organic carbon. A computer program was designed to perform a least squares analysis on all the data points to determine the shape of the curve, and the curves were then plotted on a plotter. The program which was developed will analyze as many as 15 sets of data. Analyses made on data taken from actual colored influent will provide operators with plots which show the optimum operating conditions for a particular color removal problem. CADMIUM IN THE ENVIRONMENT. A TOXICOLOGICAL AND EPIDEMIOLOGICAL APPRAISAL,
Lars Friberg, Magnus Piscator, and Gunnar Nordberg. Apr 71, 353p* APTD-0681
Contract CPA-70-30

Descriptors: (*Water pollution, Cadmium), (*Air pollution, Cadmium), (*Cadmium, *Toxicology), (*Public health, Cadmium), Exposure, Industrial wastes, Metabolism, Metabolic diseases, Respiratory system, Gastrointestinal system, Musculoskeletal disorders, Hematopoiesis, Liver, Genetics, Carcinogens, Dosage, Testis.
Identifiers: *Air pollution effects (Animals), Air pollution effects (Humans), Water pollution effects (Animals), Itai itai disease.

A review on cadmium is presented which focuses on information essential to the understanding of the toxic action of cadmium and the relationship between dose (exposure) and effects on human beings and animals. The following areas are covered in this presentation: Occurrence of cadmium possible routes of exposure and daily intake; metabolism of cadmium; respiratory effects and dose-response relationships; systemic effects and dose-response relationships; carcinogenic and genetic effects; the Itai-Itai disease. CHARACTERISTICS AND KINETICS OF BIOLOGICAL FIXED FILM REACTORS,
Billy H. Kornegay, and John F. Andrews. 1970, 227p* W71-08423, FWPCA-17050-00/70
Grant FWPCA-WP-01181

Descriptors: (*Trickling filtration, *Mathematical models), (*Trickling filters, Design criteria), (*Sewage treatment, Trickling filtration), Films, Kinetics, Mixing, Diffusion, Microorganisms, Industrial waste treatment, Dissolved gases, Substrates, Bacteria, Fluid flow.

The kinetics of biological slime films were investigated using six completely mixed, annular reactors. Design criteria for trickling filters were formerly based on experience and guesswork, so this investigation attempted to determine the kinetics of a simple system to provide a better basis for establishing trickling filter design criteria. A simple glucose and mineral base substrate was fed to microorganisms attached to the walls of the 6 annular, completely mixed reactors. The reactors were operated first in parallel, for a basic investigation of biological film kinetics, and second, in series, to approximate plug flow. Completely mixed reactors eliminated channeling, dissolved oxygen and substrate gradients, and the interdependence of velocity and flow. Film development was uniform, and liquid channeling did not occur. This investigation revealed that biological films develop in three distinct stages: (1) logarithmic growth which lasted until the active thickness was reached; (2) linear growth, between the active thickness and the plateau thickness and (3) zero growth, as all new cells are washed away. The active film thickness averaged 70 and was independent of D.O. Kinetic equations were developed which showed good correlation between theoretical and observed data. On this basis, a trickling filter design equation, based on the kinetics of the process, was developed. (WRSIC abstract)

Descriptors: (*Water pollution, *Mine waters), (*Pyrite, Mine waters), Oxidation, Mathematical models, Spoil, Mining, Chemical reactions, Microorganisms, Ferrobacillus, Thiobacillus, Oxidation reduction reactions, Iron, Sulfides.
Identifiers: *Mine acid drainage, *Water pollution control.

The report pertains to at-source control of pyrite oxidation. The current level of knowledge of acid mine drainage formation is critically reviewed, with emphasis on reaction kinetics and reactant and product transport. A reaction system model is developed which provides a conceptual framework for subsequent discussion dealing specifically with the physical, chemical, and biological characteristics of pyritic systems encountered in mining situations. Practical considerations of at-source control of acid mine drainage formation in underground mines, spoil banks, and refuse piles are presented. Deficiencies in current knowledge include: Descriptions of the physical environment existing at pyrite oxidation sites in natural systems are far more incomplete that the current understanding of pyrite oxidation kinetics; Oxygen transport is poorly described at this time but is probably the rate-controlling factor in most instances; Serious questions exist as to the effectiveness of air-sealing techniques as currently practiced; The significance of bacterial catalysis of pyrite oxidation under field conditions has not been established. GUIDES FOR SHORT-TERM EXPOSURES OF THE PUBLIC TO AIR POLLUTANTS. I. GUIDE FOR OXIDES OF NITROGEN.

1 Apr 71, 33p* APTD-0667
Contract CPA-70-57

Descriptors: (*Air pollution, *Public health), (*Nitrogen oxides, Air pollution), (*Toxicology, Nitrogen oxides), (*Respiratory diseases, *Nitrogen dioxide), Nitrogen oxide (NO), Exposure, Standards, Temperature, Age, Heredity, Physiology, Microorganisms, Instructions, Humans, Reviews.
Identifiers: *Air pollution effects (Animals), Nitrogen oxide (N2O5), Air pollution public emergency limits.

Guides for brief, intermittent exposure to nitrogen oxides have been compiled and presented. The oxides of greatest concern are nitric oxide, nitrogen dioxide and nitrogen pentoxide. Toxicological data is presented on these. Factors and conditions that can, modify and significantly alter human response to nitrogen dioxide are discussed. The most important ones are; temperature, predisposing disease, heredity, age and, interactions to other environmental pollutants. Values for short term exposure to NOx are tabulated. Experimental data on humans and laboratory animals exposed to NO2 are included in the appendices. (APCO abstract)

Identifiers: *Air pollution control, *Claus process, Molecular series, *Waste gas recovery.

A novel process for the removal of sulfur dioxide from waste gases is described. In this process, SO2 is directly reduced to elemental sulfur by hydrogen sulfide which is in turn generated by reducing part of the elemental sulfur with natural gas. The objectives of the study made on this process are as follows: to demonstrate the feasibility of each process step; to construct and operate an integrated pilot plant using a real flue gas; and to develop design and economic data for full scale application to various waste gas streams. TESTING AND EVALUATION OF OIL SPILL RECOVERY EQUIPMENT.

Dec 70, 164p EPA-WQO-15080-DOZ-12/70, W71-08942
Paper copy available from GPO $1.50 as EP 2.10:15080DOZ12/70.

Descriptors: (*Water pollution, Oils), (*Materials recovery, *Oils), (*Barriers, Water pollution), (*Skimmers, Water pollution), Mexico Gulf, Ocean currents, Booms (Equipment), Design, Performance evaluation.
Identifiers: *Oil pollution, *Water pollution control equipment.

The Gulf of Mexico, in March 1970, was the scene of a major equipment testing and evaluation study of oil spill control and recovery equipment. The tests took place during 30 knot winds, and 8 ft waves. The oil recovery equipment tested included mechanical barriers, air barriers, and skimming equipment. A detailed report containing both the test results on the capacilities and limitations of the various equipment types tested, and also recommendations on needed improvements was prepared. It was strongly recommended that adequate skimming capacity could be installed and maintained in close proximity to all major industries which would be considered potential oil spill hazards. Recommendations were also prepared concerning the methods of enlisting community aid, both in helping to support the installation of oil spill recovery equipment, and also in working to clean up such spills as do occur. CONSTRUCTION AND EVALUATION OF A KIT-FORM MICRO-WAVE OVEN,
William Kane, Jr. 1971, 29p BRH-DEP-71-7
Paper copy available from GPO $0.35 as 1715-0016.

Descriptors: (*Cooking devices, Microwave equipment), (*Kits, *Microwave equipment), Assembling, Radiation hazards, Safety, Ovens.
Identifiers: *Microwave ovens, *Microwave radiation leakage, Electromagnetic radiation hazards, Heathkit microwave oven.

A Heathkit model GD-29 microwave oven was purchased and assembled in accordance with the manual supplied with the kit. As construction progressed, problem areas were observed and recorded. Most assembly problems were of a mechanical nature. After the oven was assembled, microwave leakage was observed to be less than 1 mW/sq cm. The possibility of hazards caused by errors in construction and wiring were investigated in the areas of door construction, interlock adjustments, and interlock wiring. The Heath microwave oven which was assembled will not comply with the performance standard for microwave ovens which will become effective October 6, 1971, primarily because objects can be inserted through the open screen in the door and the resulting leakage is in excess of 5 mW/sq cm. A list of recommended modifications is presented. (Author)

Dec 70, 63p W71-09078, EPA-WQO-12010-DIM-08/70
Paper copy available from GPO $0.70 as EP210:12010-DIM08/70.

Descriptors: (*Pyrite, Depressing reagents), (*Frothing reagents, *Xanthates), (*Sulfide minerals, *Flotation), (*Depressing reagents, *Sodium sulfites), Flotation reagents, Cyanides, Toxicity, Hazardous materials, Lead sulfides, Copper inorganic compounds, Sulfides, Formates.
Identifiers: Formic acid/O-O- (diethyl-ester)-dithio-bis (thio-), Copper sulfides.

A study of pyrite depression by reducing agents with potassium ethylaxanthate as collector indicates that pyrite may be depressed effectively in the flotation of both lead and copper sulfide ores without the use of poisonous cyanide salts. More specifically, the use of sodium sulfite as the depressant may result in metallurgical, economical, environmental and safety advantages over the poison, cyanide. For example, in the case of the copper ore, the best results with cyanide as the depressant were a rougher concentrate recovery of 90.2% and a grade of 4.3% Cu. However, when sulfite was used as the depressant for the same recovery a grade of 7.3% Cu was obtained. (WRSIC abstract)

Identifiers: Fabric filters, *Solid waste disposal.

A comprehensive review of municipal incineration as it is practiced in the U.S. and several foreign countries is presented. The quantity of refuse generated and its present and future composition, as it relates to the incineration disposal method is reviewed. A study of incinerators in operation and under construction yields descriptive information on continous-feed, batch-feed, ram-feed, metal conical, and waste-heat-recovery incinerators. The design of the incinerator and of its basic components is discussed. The air pollution control devices for removal of particulates and gases are discussed. The operation, management and maintenance of incinerators are discussed. The particulate and gaseous incinerator emissions, and the methods used for their measurement are described. The review ends with presentation of data on incineration research and pilot projects. (APCO abstract)

LONG-TERM EFFECTS OF AIR POLLUTION - A FIVE-YEAR RESEARCH PROGRAM,
G. D. Robinson. May 71, 37p* CEM-4029-438
APTD-0687
Contract CPA-22-69-155

Descriptors: (*Air pollution, *Project planning), Research, Forecasting, Research management, Government policies, Earth atmosphere, Precipitation (Meterology), pH, Flue gases, Stratosphere, Urban areas, Atmospheric motion, Tracer studies, Particles, Monitors.

A program of research on long term problems of air pollution is outlined. The major problem areas are first identified, with no attempt at a formal definition of 'long-term'. Priorities are allocated to the problem areas. Research projects are then identified and tabulated, where they are classified in two ways: according to the space-scale of the phenomena involved and according to the nature of the technique of the recommended attack. The space scales are divided into, local, regional, continental and global. Priorities allocated to the projects by application of the criteria are tabulated. An overall rate of expenditure is proposed and a time-table for work on some major projects is suggested. (APCO abstract)

AEROBIC SECONDARY TREATMENT OF POTATO PROCESSING WASTES,
R. T. French. Dec 70, 181p W71-09526, EPA-WQO-12060EHV-12/70
Grant WPRD-15-01-68
Paper copy available from GPO $1.50 as EP.2.10:12060EHV12/70.

Descriptors: (*Water pollution, *Industrial wastes), (*Food processing, *Industrial waste treatment), (*Activated sludge process, Industrial wastes), Food industry, Potatoes, Biochemical oxygen demand, Coliform bacteria, Cost estimates, Clarifiers, Production engineering.
Identifiers: *Water pollution control, *Potato processing, Secondary sewage treatment.

The feasibility of using a complete mix activated sludge unit for secondary treatment of potato processing wastes was demonstrated. During the 1969-1970 processing season, both the activated sludge process and a flow through aeration process without secondary clarification were studied. The activated sludge unit was demonstrated to be capable of BOD removals, in excess of 90% over extended periods, with coliform removals in excess of 96%. With the flow through system, BOD removals ranged between 70 and 80%. Analysis of data obtained revealed that both the quantity of excess sludge produced and the amount of oxygen required were functions of the BOD removal rate and the mixed liquor volatile suspended solids concentration. The substrate removal rate coefficient was shown to be temperature dependent. The prevailing low air temperatures at the Shelley location did not cause system failure, but data obtained demonstrated the need to consider temperature loss in system design. Total annual treatment costs, excluding costs for waste activated sludge disposal, were estimated to be $.038 per lb BOD applied, and $0.21 per lb COD applied. Operation of thickener-clarifier on combinations of silt and biological solids was not successful. Failures with this unit demonstrated a need for the development of special silt removal and handling equipment for potato processing. (WRSIC abstract)

Waste waters from a Fortrel Polyester manufacturing plant consisted of organic chemical process wastes, cooling system blowdown, and sanitary wastes from the plant. A water reuse program was instituted which consisted of: (1) pretreatment of cooling waters for removal of heavy metals; (2) in-plant modifications and additions to the existing system to increase treatment plant capacity; and (3) a post treatment system for effluent polishing prior to selected reuse. The final system consisted of: (1) a chromate reduction unit rated at 120 gpm for concentrations of up to 300 mg/l CrO4 and designed for continuous operation; (2) equalization basins having a combined capacity of 195,000 gallons and containing sufficient mixing capacity to prevent short-circuiting and stratification; (3) a plastic media roughing filter consisting of two tiers of poly-vinyl chloride media 10 feet thick and 25 ft in diameter; (4) an aeration basin equipped with 175 hp of aeration and mixing capacity and using 100% recycle of clarifier sludge; (5) a peripheral flow type clarifier; (6) two series connecting polishing ponds; (7) a micro screen or algae screen; (8) a flocculant and/or carbon unit; (9) a sludge pond; and (10) a digester. Chromium was removed from the cooling tower blowdown for $.21 per pound of chromate removed. The plastic media trickling filter, used as a roughing filter, provided 40% BOD removal over a wide range of loading rates. The 0.33 mgd industrial and domestic waste water was treated and reused at a rate of 0.10 mgd for approximately 40 cents/1000 gallons. (WRSIC abstract)

MATHEMATICAL MODEL OF THE ELECTRODIALYSIS PROCESS.
Water pollution control research series,
Kenneth T. Pruyn, Joseph J. Harrington, and J. Douglas Smith. Jul 69, 78p W71-09525
FWQA-17090-FTA-07/69
Contract FWQA-14-12-410
Paper copy available from GPO $0.70 as I67.13/4:ORD17090FTA07/69.

Descriptors: (*Desalting, Electrodialysis), (*Electrodialysis, *Computerized simulation), (*Demineralizing, Electrodialysis), (*Mathematical models, Electrodialysis), Computer programs, Cost estimates, Membranes, Design, Fouling, Industrial engineering, Piping systems, Operating costs, Capital costs.

A desalination electrodialysis unit was established as a control volume, and material balances around the control volume were formulated, involving input and output flows, types of charged particles to be exchanged, concentrations of charged particles, and percentage removal of individual ions as well as percentage removals of total ions. Significantly parameters involved included spacer design geometry, membrane properties (resistivity, current efficiency, separation factors, etc.) and mode of operation of the stack (current density, products stream concentration, waste/product ratio, waste stream pH, etc.). Performance equations were then formulated for resistivity, D.C. power input, current efficiency, number of stacks required, and the pumping headloss. Cost analyses were derived to include: electrodialysis stacks, stack piping, distribution piping, and pumps for stack related costs; rectifiers and process electrical for D.C. power costs; and acid storage tanks, acid feed pumps, instruments, and miscellaneous equipment for auxiliary costs. Equations derived for capital costs and operational costs were based on the January 1965 Engineering News-Record cost index. The program was run for plants of 1, 10, and 100 MGD, with capital and operating costs being $164,620 and 7.07cents/1000 gallons respectively for a 1 MGD plant. Program flow charts as well as actual computer outputs are presented. (WRSIC abstract)

GUIDELINES: AIR QUALITY SURVEILLANCE NETWORKS.
May 71, 21p AP-98
Paper copy available from GPO $0.20 as EP4.9:98.

Descriptors: (*Air pollution, *Monitors), Instructions, Government policies, Design, Networks, Data processing, Data acquisition, Data retrieval, Management planning, Gas sampling, Instruments.
Identifiers: *Air Quality Surveillance Network, *Air Quality Control Regions, Air pollution detection.

The development of an air quality surveillance program is an inherent part of the control effort of the operation of Air Quality Control Regions. Guidelines are presented here which will assist State and local agencies in setting up air quality surveillance programs. The development of an air quality surveillance program includes determining the number and location of sampling sites, selecting appropriate instrumentation, and establishing a data information system. The report deals with four major aspects of regional surveillance: (1) objectives of surveillance, (2) design of a minimally adequate surveillance network, (3) laboratory requirements, and (4) data acquisition and analysis. CONTROL OF INFILTRATION AND INFLOW INTO SEWER SYSTEMS.

Dec 70, 131p W71-09591, EPA-WQO11022-EFF-12/70
Contract DI-14-12-550
Paper copy available from GPO $1.25.

Descriptors: (*Sewers, Fluid infiltration), (*Water influx, Control), (*Waste water, Sanitary engineering), Urban areas, Surveys, Problem solving, Leakage, Joints (Junctions), Cracks, Manholes, Drains.

Problems were studied of infiltration of ground and surface waters into sanitary sewers and inflows from various connections to these sewers. Such water enters sewers through joints, cracks, breaks or indirectly through perforated or loose manhole covers or other faulty sewer structures. Inflow water is piped into the sewer from basement and foundation drains, roof leaders, and other legal or illegal connections of storm sewers and combined sewers. Two hundred and twelve public jurisdictions in the United States and Canada were contacted, and twenty-six communities were visited. Practices of consulting engineers and state and provincial water pollution control agencies were also surveyed. Twenty recommendations are given indicating the need for extensive investigation of the extent of the infiltration/inflow problem before relief sewers are constructed or wastewater treatment plants built or enlarged. Springfield Sanitary District, Ill.
RETENTION BASIN CONTROL OF COMBINED SEWER OVERFLOWS.
Aug 70, 104p W71-09592, FWQA-11023-08/70
Contract EPA-WQO-3-111-1
Paper copy available from GPO $1.00.

Descriptors: (*Combined sewers, Catch basins), (*Overflows, Control), (*Sanitary engineering, Illinois), Flood control, Storms, Rainfall intensity, Pumping stations, Streams, Water storage, Sewage disposal, Water pollution, Urban planning.
Identifiers: Springfield (Illinois), Retention basins.

The document reports on a 10 acre basin to collect and detain combined sewer overflows that bypass a pumping station during periods of high volume flow. Surface runoff accompanying rainstorms cause high volume flows which are diverted into the station channel. Such flows introduced highly toxic pollution loads into an Illinois creek and a fork of the Sangamon River. The retention basin was built to intercept these flows so that they could be stored temporarily and released at low flow rates to avoid shock pollution. In addition to the oxygen demand, production of algae may be objectionable at some installations for aesthetic reasons. Sludge accumulation must be taken into account in design of similar facilities. Suggestions for future designs of retention basins are included. (WRSIC abstract)

A SURVEY AND ASSESSMENT OF AIR POLLUTION DAMAGE TO CALIFORNIA VEGETATION IN 1970,
Arthur A. Millecan. Jun 71, 57p* APTD-0694
Contract CPA-70-91

Descriptors: (*Vegetation, *Air pollution), (*California, Air pollution), Damage, Injuries, Plants (Botany), Economic factors, Fruits, Flowers, Plant pathology, Vegetable crops, Smog.
Identifiers: *Air pollution effects (Plants).

A state wide survey was made in California to determine the areas of occurrence of plant injury due to air pollutants, and to assess the damage to agricultural plant crops. On the basis of observations and evaluations made by agricultural specialists California's 1970 crop losses due to air pol-

lutants were estimated to be approximately $25,690, 680. The losses were confined to 15 of the 58 counties in the state. The monetary loss figure does not include losses attributed to reduction in crop yield as a result of invisible damage with the exception of citrus and grapes. (APCO author)

Contract PH-86-68-86
See also Rept. on Phase 3, PB-200 882.

Descriptors: (*Flue gases, *Desulfurization), (*Sulfur dioxide, Sorption), (*Sorbents, *Aluminum oxide), (*Air pollution, Sulfur dioxide), Regeneration (Engineering), Comminution, Beds (Process Engineering), Fluidized Bed processors, Dispersing, Economic evaluation, Electric power plants.
Identifiers: Alkalized alumina.

The results of a contractual effort to correlate and evaluate data from several sources, on the development of the alkalized alumina sorbent and process are reported in two phases: Phase I - data evaluation and preliminary process design, and Phase II - process optimization studies. This report includes an analysis of available attrition data, and a summary of the attrition test methods used. The process design study includes an evaluation of; sorption chemistry, current sorption data, and sorption modeling. Regeneration reactions and evaluation of the status of the data are presented with discussion of pilot plant results, bench scale tests with reducing gases, and evaluation of various sorbents. Process description; calculation, and vessel design are presented for three process designs; dispersed phase, fluid bed, and fixed bed. A stream reformer, a claus plant and a precipitator, are included for each process. A comprehensive economic analysis of the process is also included. (Author)

Descriptors: (*Flue gases, Desulfurization), (*Desulfurization, Economic evaluation), (*Sulfur dioxide, Sorption), (*Air pollution, Sulfur dioxide), Regeneration (Engineering), Electric power plants, Costs, Sorbents, Oxides, Beds (Process engineering).

A cost sensitivity study has been made in which the effects of major process parameters on plant investment and operating costs have been determined. A tabulation of the parameters studies is included. Results are reported as changes from the base case values which were obtained from the previously completed phases 1 and 2 evaluations. Three battery limits base case process designs were developed in phases 1 and 2 (dispersed phase, fluid bed, fixed bed), but not all of the variables were evaluated in phase 3 for three designs. A copy of the flow sheet, process description, battery limit investment and operating cost for each of the base case designs is included for reference. A brief summary of the results on economics of the major process variables studied is shown. As a reference case, the base case investment and operating costs are also shown. (Author)

AN ECONOMIC ANALYSIS OF PROPOSED SCHEDULES FOR REMOVAL OF LEAD ADDITIVES FROM GASOLINE.

25 Jun 71, 233p* RGH-015 APTD-0703
Contract EPA-CPA-68-02-0050
Errata sheet inserted.

Descriptors: (*Gasoline, *Economic analysis), (*Lead organic compounds, Removal), (*Air pollution, Lead organic compounds), Exhaust emissions, Petroleum industry, Marketing, Feasibility, Scheduling.
Identifiers: Air pollution control.

An investigation of the economic impact of various gasoline removal schedules is reported. These schedules varied in rapidity of lead removal and in the number of gasoline grades produced. Eleven proposal schedules were grouped into two classes, one related to a two-pump market system, the other to a three-pump system. In all cases one grade of gasoline was required to be lead free by 1974 to satisfy the needs of any 1975 model cars equipped with exhaust reactors requiring unleaded fuel. The basic research octane level of this gasoline was set at 93 RON. A feasibility analysis, which was required for all eleven schedules, examined approximate capital costs, pool octane numbers, aromatics concentrations, prime blending component requirements, and year-to-year rates of increase in gasoline volume times octane. A preliminary selection was made of the slowest and fastest lead removal schedules for 3-grade cases and for 2-grade cases. Spot year detailed analysis of all schedules was also determined. The report includes a detailed summary of conclusions, and a detailed description of the methodology used. (Author)

STUDY OF THE SOCIAL AND ECONOMIC EFFECTS OF CHANGES IN AIR QUALITY.
Annual rept. Jul 70-Jun 71,
R. Charles Vars and Gary W. Sorenson. Jun 71, 70p APTD-0696
Contract CPA-70-117

Descriptors: (*Air pollution, *Economic surveys), (*Sociology, Air pollution), Refuse disposal, Costs, Industries, Social psychology, Populations, Attitudes, Control, Oregon.
Identifiers: Air pollution control, Open burning, Willamette Valley.

A 2-phase research effort is summarized. The first phase is concerned with measurement of the economic changes consequent to the introduction of various air pollution control policies. Areas of specific concern in this phase are as follows: the pollution production function; measurement of the costs of regulating open field burning in the Willamette Valley; the impact of air quality variations on tourist related industries. The second phase deals with social effects. A theoretical model concerning the effects of air quality changes on peoples attitudes and mass media use patterns has been formulated as a means of measurement of change. Each of the following objectives which relate to this model, are discussed: completion of interviews and evaluation of response rates; completion of coding, key punching and varification; completion of visibility measures; analysis of air quality perceptions of respondents; analysis planned for the forthcoming year. Descriptors: (*Air pollution, *Sulfur dioxide), (*Adsorption, Sulfur dioxide), (*Adsorbents, *Limestone), (*Infrared Spectroscopy, Adsorption), Infrared spectrometers, Calcines, Chemical analysis, Electron probes, X ray spectroscopy, Impurities, EDTA, Potassium halides, Calibration, Roasting, Scrubbers.
Identifiers: *Gas surface interactions, *Air pollution control, Auger electron spectroscopy.

Investigations have been conducted in an effort to develop rapid reliable methods for analysis of reacted limestone and limestone slurries. In this area new thin film infrared cells have been developed and demonstrated. The cells developed were then used to obtain calibration curves for species of interest in several solvent systems which would be of use in analyzing either reacted solid limestones or limestone slurries. In another phase of this program, a study was made of the influences of impurities on the dead-burning of limestone. Specifically, a study using infrared spectroscopy, electroprobe investigations and auger spectroscopy revealed both the occurrence of chemical reactions between lime and limestone and impurities at higher calcination temperatures and diffusion of impurities to surfaces and into pores. SYSTEMS STUDY OF DATA AVAILABILITY ON NATURAL GAS.

Jun 71, 111p* APTD-0701
Contract EPA-APO-A-501

Descriptors: (*Natural gas, Information systems), (*Information centers, Planning), Data storage, Information retrieval, Cost engineering, Marketing, Production rate, Resources, Prices, Demand (Economics), Computer programming.
Identifiers: Data banks.

The report discusses the availability of natural gas data, sources of data, data deficiencies, and the cost of instituting a data bank. It has been proposed that a natural gas data bank be established using data sources which are credible, ongoing, providing a continuous data series, yielding specialized information, and sufficiently uniform for programming. The data bank will show the dynamic phases of natural gas supplies from potential resources to proved reserves and annual production. The computerized data will indicate the manner in which domestic and foreign supplies are linked to the U.S. markets and utilized by residential, commercial, electric utilities, industrial, and other consumer sectors within specific areas. Information pertinent to natural gas supply development rates, natural gas prices, current and future consumer demands, and sulfur quality evaluations will be entered in the data bank. BIOLOGICAL EFFECTS OF COPPER AND ARSENIC POLLUTION.
Final rept.,
D. K. Button, and S. S. Dunker. Apr 71, 61p* R71-8 W71-10637, EPA-WQO-18050-DLW-04/71

Descriptors: (*Water pollution, *Marine microorganisms), (*Copper, Water pollution), (*Arsenic, Water pollution), (*Toxicology, Water pollution), Phosphates, Metabolism, Manganese, Antimetabolites, Nutrients, Trace elements, Microbiology, Marine biology, Yeasts.
Identifiers: *Water pollution effects (Animals).

Inhibitory effects of copper toward marine microorganisms were studied. Phosphate was found to prevent copper inhibition. Growth and phosphate flux kinetics were described. These phosphate limited systems were found to be copper sensitive only under conditions of manganese deficiency. Toxicity occurred in this normally rather resistant yeast and in hydrocarbon oxidizing microorganisms at about .000001 M. Arsenate was among a number of metabolic inhibitors found to inhibit phosphate transport; phosphate also competitively reduced arsenate uptake. Both arsenate and phosphate are accumulated by the same active transport system in which velocities increase as the hydrogen ion is increased, saturation of the system does not occur, and the transport temperature coefficient is very large. Both arsenate and copper are important at existing concentrations in the environment. When nutrients are dilute these antimetabolites prevent microbial metabolism thus affecting the steady state chemistry which they control. Toxicity levels of antimetabolites depend not only on populations and chelate concentrations but in a major way on free nutrients and trace metal levels. (Author)

OXYGEN REGENERATION OF POLLUTED RIVERS: THE DELAWARE RIVER,
William Whipple, Jr., Joseph V. Hunter, Frank W. Dittman, Shaw L. Yu, and George W. Mattingly.
Dec 70, 93p W71-10638, EPA-WQO-16080-DUP-12/70
Paper copy available from GPO $1.00 as EPA 16080 DUP 12/70.

Descriptors: (*Water pollution, *Oxygenation), (*Waste treatment, Oxygenation), (*Stream pollution, Waste treatment), (*Aerators, Stream pollution), Aeration, Oxygen, Rivers, Cost estimates, Diffusers, Biochemical oxygen demand, Abatement.
Identifiers: *Water pollution control methods, *Water pollution control equipment.

Tests of surface instream aerators and of bottom diffuser aerators were conducted on the Delaware River near Philadelphia in order to determine the practicability of induced oxygenation of deep navigable rivers. The diffuser was tested at various depths up to 38 feet, but its performance in pounds of oxygen per horsepower hour decreased markedly in the deeper water. Performance of the surface aerator appeared to be somewhat improved over results previously found in a shallower river. Cost estimates and systems analysis led to the conclusion that induced oxygenation by aerators appears to constitute an economical alternative to advanced waste treatment on the Delaware River. This would require structurally reinforced surface aerators in some areas, and bottom diffuser aerators where the surface aerators would interfere with navigation. However, oxygen diffusers developed by others may provide an even more economical means of induced oxygenation for such rivers. (Author)

TOXIC ACTION OF WATER SOLUBLE POLLUTANTS ON FRESHWATER FISH,
Paul O. Fromm. Dec 70, 59p W71-10639, EPA-WQO-18050-DST-12/70
Paper copy available from GPO $0.65 as EPA 18050 DST 12/70.

Descriptors: (*Water pollution, Insecticides), (*Fishes, Water pollution), (*Insecticides, *Aquatic biology), Chromium, Diffusion, Ammonia, Toxicology, Stress (Physiology), Trout, Sodium, Dieldrin, Malathion, Sulfonates, Blood plasma.
Identifiers: *Water pollution effects (Animals).

Over a five year period experiments on rainbow trout indicated that exposure to chromium and to forced exercise caused a transient increase in plasma cortisol. Exposure to ammonia (a) caused a decrease in the rate of total nitrogen excretion and in ammonia excretion (b) caused some histopathological changes in trout gills but oxygen transport by hemoglobin was unaffected (c) caused a very slight increase in urea excretion by trout but a very significant rise in goldfish. Hyperexcitability observed in ammonia-exposed trout was not noticeable in the more resistant goldfish. Ammonia may kill fish by prevention of excretion of normal amounts of endogenous ammonia. Experiments with isolated-perfused gills of trout have shown among other things that (a) gill blood flow patterns are significantly affected by epinephrine (b) when perfused with Ringer solution there was a small but significant loss of sodium into the bath solution (c) perfusion fluid sodium and epinephrine appear to control sodium uptake by the gill (d) transfer of dieldrin into the vascular system occurred only when plasma protein, or more probably plasma lipoprotein was present in the perfusion fluid (e) short term exposure to dieldrin, rotenone, malathion and MS-222 reduced perfusion flow rate through isolated gills

but exposure to 1 mg/L methoxychlor was without effect. Decrease in flow rate correlated well with lamellar perfusion. (Author)

AN ELECTROMEMBRANE PROCESS FOR REGENERATING ACID FROM SPENT PICKLE LIQUOR.
Robert E. Lacey. Mar 71, 85p W71-10640, EPA-WQO-12010-EQF-03/71
Paper copy available from GPO $1.00 as EPA 12010 EQF 03/71.

Descriptors: (*Pickling compositions, *Materials recovery), (*Ion exchanging, Pickling compositions), (*Industrial waste treatment, Pickling compositions), Sulfuric acid, Cation exchanging, Anion exchanging, Iron and steel industry, Membranes, Regeneration (Engineering), Cost estimates, Water pollution.
Identifiers: Water pollution control.

Studies of an electromembrane process for regenerating acid from spent sulfuric acid pickle liquor have indicated that the process is technically feasible. The studies have shown that the iron ions in spent pickle liquor can be removed and replaced by hydrogen ions to regenerate H2SO4 in electromembrane cells. A method of removing iron from spent liquor that involves the formation of insoluble iron hydroxides is preferrable to plating iron metal onto cathodes. Estimated treatment costs were $0.045 plus or minus 0.002 per gallon, whereas the combined costs of purchasing acid and disposing of spent liquor by existing methods were in the range of $0.015 to $0.06 per gallon of spent liquor. A determination of the long-term performance of the ion-exchange membranes when treating actual pickle liquors that contain organic pickling aids is needed. (Author)

VORTEX SEPARATION FOR OIL SPILL RECOVERY SYSTEMS.

Oct 70, 62p* W71-10653, EPA-WQO-15080-EUU-10/70
Paper copy available from GPO $0.60 as EPA 15080 EUU 10/70.

Descriptors: (*Water pollution, Oil recovery), (*Oil recovery, Separators), Vortex generators, Skimmers, Vacuum apparatus, Overflows, Prototypes, Tests.
Identifiers: *Oil spills, *Vortex separation process, *Oil water separators.

In recent years the subject of oil spills has become of increased public interest. The demand for quick, effective solutions to the problem has brought about extensive programs for the development of equipment and technology for the safe, fast and efficient recovery of spilled oils from water. Research was begun to develop a full scale prototype oil/water separator, potentially capable of filling the need for a continuous, rapid, efficient oil/water separator, operable in choppy to moderately heavy seas, and capable of separating low concentration oil/water mixtures into recovered oil nearly free of water and clear water suitable for return to sea. A simple vortex separation process is described.

Report on the Feasibility of Joint Municipal and Industrial Wastewater Treatment in the Onondaga Lake Watershed, Onondaga Coubty, New York.

Descriptors: (*Industrial wastes, Waste treatment), (*Sewage, Waste treatment), (*Waste treatment, *New York), Lakes, Watersheds, Stabilization, Cost estimates, Sludge, Waste water, Sampling, Toxicity, Feasibility.
Identifiers: Onondaga Lake Watershed, Onondaga County.

A feasibility study to determine the practicality of joint treatment of municipal and industrial wastewater was initiated in Onondaga County, New York. The 24 industries included in both the Ley Creek and the Metropolitan Sanitary districts were contacted as to their production of wastewaters and their effluents samples as needed. Bench scale studies were then used to determine the feasibility of the various activated sludge systems. A sampling and analysis program was conducted to determine the characteristics of the wastewater influents to both plants, with the results indicating that although toxicity was a potential problem it was causing no problems at present. Therefore, the primary pollutant to be removed as organic material. Total organic loads at both the Ley Creek and the Municipal Plant were equal, but flow to the Municipal Sewage Treatment Plant was nearly three times as great as the flow to Ley Creek. The Municipal Sewage Treatment Plant was chosen as the outfall because of greater dilution capacity of Onondaga Lake. Activated sludge treatment of the primary effluent of both plants was shown to be feasible, with the Ley Creek Sewage treatment plant destined for eventual phasing-out. Cost estimates for different system configurations (conventional activated sludge, contact stablization, etc.) ranged from $23,000-$30,000 for capital cost and $3,700-$4,400/year for operation and maintenance. POLYMERIC MATERIALS FOR TREATMENT AND RECOVERY OF PETROCHEMICAL WASTES.
Water pollution control series,
Elias Klein, Shyamkant V. Desai, James K. Smith, and Robert E. C. Weaver. Mar 71, 78p W71-10651, EPA-WQO-12020-DQC-03/71
Paper copy available from GPO $0.70/copy as E.P.2.10:12020DQC03/71

Descriptors: (*Industrial waste treatment, *Osmosis), (*Chemical industry, Industrial waste treatment), (*Water pollution, *Petrochemicals), (*Glycerol, Industrial waste treatment), Membranes, Pilot plants, Cellulose acetate, Permeability, Capillary tubes, Cost estimates.
Identifiers: *Reverse osmosis, *Water pollution control.

Three operational modes for removing glycerin from waste streams by reverse osmosis were examined. The three modes were: (1) a single-stage reverse osmosis unit which was demonstrated to be capable of removing 27% of the available glycerin, 92% of the inorganics, and 94% of the polyglycerines available in the feed; (2) a three-battey multi-stage unit with forward feed of the raffinate to subsequent reverse osmosis recovery batteries which provided a product stream containing 31% of the available glycerin, no inorganics, and 3.9% of the available polyglycerines; and (3) an alternate two battery multi-stage counter-current recovery unit which provided a waste stream containing 31% of the available glycerin, no inorganics, and 5.2% of the available polyglycerines. Membranes used were asymmetric cellulose acetate butyrate and cellulose acetate. Experimental pilot scale studies performed with tubular membrane models readily accommodated the sample plant stream being used. Optimum selectivity and good separation was achieved under operating pressures ranging from 600 to 800 psig. Product throughput rate appeared to be the limiting factor, being highly sensitive to both increased turbulence and reduced feed viscosities. A cost analysis of a typical multi-stage forward feed operation operated at 600 psig was estimated. Payout for the operation was 3.8 years at a 26% rate of return, making it an extremely favorable investment. (WRSIC abstract)

FLEXIBLE HOLDING TANK FOR PLEASURECRAFT SANITARY SYSTEM.
Water pollution control research series,
Mark W. Olson. Aug 70, 54p W71-10652, EPA-WQO-15020-DGR-8/70
Contract FWQA-14-12-506
Paper copy available from GPO $0.55/copy as E.P.2.10:15020DGR8/70.

Descriptors: (*Storage tanks, Design criteria), (*Boats, *Sewage disposal), Environmental engineering, Water pollution, Structural members, Synthetic elastomers, Expandable structures.
Identifiers: *Waste storage, *Pleasure craft.

The problem of increasing numbers of small pleasurecraft and resulting increases in the pollution problems resulting from the sanitary wastes from these crafts has caused much concern. Formerly the waste from these crafts was dumped into the surrounding water, causing major pollution difficulties. Of the several possible means of handling sanitary waste from small pleasurecrafts, the most direct would be storing of the waste until it could be disposed of on shore, perhaps after treatment. One of the main problems in development of such a disposal system in small crafts is the probable lack of space for installation of a holding tank. A means of overcoming this obstacle has been sought through the use of a flexible holding tank which could allow for installation in hidden and almost inaccessible places with a minimum of structural changes. The design criteria calls for an accordion-pleated tank to be made of elastomer coated nylon fabric with ten 60 degree v-shaped pleats with a cross section of 14 inch by 24 inch and holding about 18 gallons of fluid. This tank could collapse to fit a much more restrictive space and can actually expand to 21 inches to provide a capacity of nearly 25 gallons. The results showed that a tank of the specified materials provides an acceptable and versatile holding tank for upgrading a sanitary system on small pleasurecraft, particularly in the 22 to 28 foot length.

MUNICIPAL SEWAGE TREATMENT WITH A ROTATING BIOLOGICAL CONTACTOR.
Final rept.,

May 69, 66p W71-10655, FWPCA-17050-DAM-05/69
Contract FWPCA-14-12-24

Descriptors: (*Sewage treatment, *Contactors), Biochemical oxygen demand, Microorganisms, Nitrogen, Phosphorus, Particles, Clarification.

The Milwaukee Metropolitan Sewerage Commission installed a rotating biological contactor (RBC) to treat municipal sewage. The RBC obtained in excess of 90% BOD removal at loading rates of 350 to 400 lbs COD per day per 1000 cu. ft. of disc volume. Nitrogen was shown to be removed in a ratio of 1:25, nitrogen to COD. Percent BOD removal was consistently 5% greater than percent COD removal. Treatment efficiency was increased with increased detention time, and decreased by: (1) lower disc speed; (2) lower strength wastes; and (3) high hydraulic loading. Recovery from periods of high hydraulic loading was extremely quick. Further planned investigations included isolation and identification of individual species of microorganisms and comparison with the microorganisms of activated sludge and trickling filters. BENEFICIAL USES OF WASTE HEAT - AN EVALUATION,
Roland R. Garton, and Alden G. Christianson. Sep 70, 11p W71-10748 EPA-WQO-16130-FHJ-09/70
Presented at Conference on Beneficial Uses of Thermal Discharges. Sponsored by New York State Dept. of Environmental Conservation, Albany, New York, 18 September 1970.

Descriptors: (*Water pollution, *Heat), (*Cooling water, Utilization), Evaluation, Aquaculture, Ecology, Economic analysis.
Identifiers: *Thermal pollution.

Discussed are a number of proposed beneficial uses of waste heat contained in power plant cooling water. Included are those for which the technical feasibility has been demonstrated in pilot programs and those which are, at best, imaginative ideas. Primary concern is with solving the environmental pollution problem. Seen from this standpoint, a beneficial use must help reduce the thermal pollution problem directly or must provide a profit to help off-set the cost of cooling devices. The use must not result in additional pollution such as that resulting from untreated organic wastes. Some uses, such as the culture of certain fishes, are now at the pilot program, or even commercial, stage. Other uses, such as for industrial processes, require additional research. Integrated systems planned to produce steam as well as electrical power have been successful in special situations. In nearly all cases additional information is needed on the overall economics of proposed methods. This is especially true where high quality heat is taken directly from the power plant steam cycle for another use. Only with a complete economic analysis, including cost of distribution and waste treatment, can the final decision be made as to whether a 'beneficial use' is truly beneficial in the long run. STORM AND COMBINED SEWER POLLUTION SOURCES AND ABATEMENT, ATLANTA, GEORGIA.

Jan 71, 184p W71-10749, EPA-WQO-11024-ELB-01/71
Contract FWQA-14-12-458

Descriptors: (*Storm sewers, Water pollution), (*Combined sewers, Water pollution), (*Urban planning, *Georgia), Abatement, Overflows, Storms, Surface water runoff, Waste water, Waste treatment, Benefit cost analysis, Sources, Water quality, Water storage, Biochemical, Oxygen demand, Urban areas.
Identifiers: Atlanta (Georgia), *Water pollution control.

Six urban drainage basins in Atlanta, Georgia, served by combined and separate sewers, were studied to determine the major pollution sources during storm events. Rainfall frequency analysis and simulation techniques were utilized to obtain design criteria for alternative pollution abatement schemes. High frequency storms cause the worst impact and most of the pollution from combined sewer areas. Annual BOD from these areas is 2,078,000 pounds, or 460 lbs/acre, of which 57 percent is due to storms of two--week or higher frequency. Bypassing of wastewater treatment plant flows during storms adds 690,000 pounds BOD/year. Runoff from storm--sewered areas, at 253 lbs/acre, adds 5,577,000 pounds/year. Overflows and bypassed flows have severe impact upon the South River, due to their high deoxygenation rates and coliform concentrations. Annual BOD reduction from combined sewer areas of 57 percent may be achieved for a total annual cost of $165,000, by modifying the three regulators and treating 80 percent of the overflows, in conjunction with storage sufficient to contain a two--week storm. SELECTIVE WITHDRAWAL FROM A STRATIFIED RESERVOIR,
Jorg Imberger, and Hugo B. Fischer. Dec 70, 166p W71-10750, EPA-WQO-15040-EJZ-12/70
Paper copy available from GPO $1.00 as EPA 15040 EJZ 12/70.

Descriptors: (*Reservoirs, Fluid flow), (*Water quality, Mathematical prediction), Stratification, Density, Model tests, Boundary layer flow, Thickness, Dyes, Isotopic labeling, Mathematical models, Hydraulic gradients, Density (Mass/Volume), Interfaces.
Identifiers: Stratified reservoirs, Selective withdrawal.

The study describes both theoretically and experimentally the flow into a line sink in a linearly density stratified reservoir. The geometry of the boundaries is simplified to a parallel walled duct with the line sink at the center of the fluid. The primary focus is on partitioning the flow into distinct flow regimes, and predicting the withdrawal layer thickness as a function of the distance from the sink. Laboratory experiments verified the conclusions reached from the theoretical considerations. The withdrawal layer thicknesses were shown to be closely predicted by the integral solution. Comparison with measurements made by the Tennessee Valley Authority indicates that in a reservoir the withdrawal layers are approximately one and a half times as large as predicted. The difference in thickness is probably explained by the presence of a certain amount of turbulence in the reservoir, and interference by the rear boundary of the reservoir. (WRSIC abstract).

ATMOSPHERIC CONTAMINATION AND TRIBO ELECTRIFICATION.
Final rept., 1 Jun 68-31 May 70,
Edward E. Weaver, and Clyde Orr, Jr. 31 May 70, 46p GIT-B-366 APTD-0629
Grant PHS-AP-77741-02

Descriptors: (*Electrostatic charge, Friction), Static electricity, Air pollution, Humidity, Gases, Vapors, Surface chemistry.
Identifiers: Triboelectric effect

Tribo electrification between various substrates and platinum was investigated with a number of gases, vapors, and gas mixtures present in order to determine the effects of humidity and gaseous pollution and to investigate the mechanisms of frictional charging. The substrates were formed into discs and rotated against platinum in a chamber which could be evacuated and filled with any gas or gas mixture at pressures up to atmospheric over a range of temperatures. Results confirmed that in pure air, water vapor exerts a predominant influence on electrostatic charging and suggested that a maximum occurs in the generated voltage conditions such that a layer of adsorbed water a very few molecules thick was present. Other experiments indicated that, in the presence of air, most pollutant gases had only a slight effect on the voltage generated. In the presence of air, no gases were found that caused an increase in tribo electrification. (Author)

FURTHER DEVELOPMENT OF THE PHOTOCHEMICAL SMOG MODEL FOR THE LOS ANGELES BASIN.
Final rept.,
A. Q. Eschenroeder, and J. R. Martinez. Mar 71, 66p GRC-CR-191-1 APTD-0678

Descriptors: (*Air pollution, *Atmospheric diffusion), (*Smog, *Atmospheric motion), Photochemical reactions, Nitrogen oxides, Mathematical models, Reaction kinetics, Ozone, Mixing.

Results of research conducted on the further development of an earlier atmospheric diffusion model are presented. The work has resulted in a diffusion model with photochemistry that is applicable to pollutants that undergo chemical changes. The techniques used in the report have been advanced to the stage where they can be adapted to the planning and implementation of air pollution abatement measures. The photochemical description has been extended to account for varying ratios of nitrogen to hydrocarbon. Some hypotheses of carbon monoxide interactions have been tested. Descriptions are given also of numerical integration improvements, and of refinements in the meteorological realism of the model. Finally, the paper presents validation tests for Los Angeles basin data and the significance of the results are discussed in terms of future applications of the technique. (APCO Abstract)

SECONDARY ZINC INDUSTRY EMISSION CONTROL PROBLEM DEFINITION STUDY. PART I. TECHNICAL STUDY.
Final rept.,
William O. Herring. May 71, 150p* APTD-0706

Descriptors: (*Metal industry, Air pollution), (*Zinc inorganic compounds, *Air pollution), Metal scrap, Zinc oxides, Zinc chlorides, Materials recovery, Metallurgical furnaces, Particles, Economic analysis, Impurities.
Identifiers: *Zinc industry, *Air pollution control.

Effluents containing particulate and gaseous emissions are exhausted from certain processes of the secondary zinc industry. Data on those emissions with related emission-control and process data were obtained from a sampling of plants. These data were evaluated to obtain the results of this study. Emissions from sweat processes occur at very low rates where the processed zinc scrap contains only small amounts of impurities. However, very significant emissions of particulate and gaseous carbonaceous substances, and particulate zinc oxide and zinc chloride may occur when there are substantial amounts of impurities in the scrap. The results of this study indicate that emission factors for zinc sweat processes range from zero to around 32 pounds of particulate per ton of scrap material processed. The results further indicate that the emitted particulate may be composed of zero to 34 percent $ZnCl_2$; 40 to 100 percent ZnO; and small percentages of carbonaceous substance. Several emission-control concepts were developed based on findings of the study, and recommenda-

tions are made for further research and development. (Author)

Descriptors: (*Sewage treatment, Filtration), (*Water treatment, Filtration), (*Ultrasonic cleaning, *Filtration), Backwashing, Combined sewers, Storm sewers, Feasibility studies, Algae, Colloids, Cost estimates, Sedimentation, Particle size.

The feasibility, both economic and technical, of using ultrasonic filtration as an aid to removing suspended impurities was investigated. Inputs to the test apparatus included drinking water, simulated sewage, primary and secondary sewage effluents, algae pond effluent, coarsely screened, raw sewage diluted 2:1, 5:1, and 10:1 with simulated storm drainage, and deliberately concentrated raw sewage. Dirt, sand, and leaves were added in some test runs with no apparent effect on performance. 20 and 50 micron filter elements, operated at approximately 10 gpm/sq ft2 with head losses from 1 to 4 psi, reduced the BOD and suspended solids of raw sewage diluted in varying degrees with water by an average of 40 and 70% respectively. System performance was intermediate between that of primary and secondary treatment. Other benefits included: Application of ultrasonic energy increased the total quantity of effluent filtered between backwash cycles; from 4 to 18 times that treated with similar equipment without ultrasonics applied; and Application of ultrasonic energy restored the filter elements to 'like-new' condition without necessitating frequent filter replacement. Cost figures for an ultrasonic filtration system capable of handling 1.4 mgd, exhibiting performance midway between primary and secondary treatment, and occupying only several hundred square feet, ranged between 2.8 and 3.5 cents/ 1000 gallons. By comparison, combined primary-secondary treatment cost figures were reported as 10 cents/1000 gallons excluding the cost of the considerable amount of land involved. (WRSIC abstract)

UNITED STATES COAL RESOURCES AND PRODUCTION.
Interim rept.

Jun 71, 51p APTD-0713

Descriptors: (*Coal deposits, *Production capacity), (*United States, Coal deposits), Bituminous coal, Subbituminous coal, Lignite, Anthracite, Ash content, Sulfur, Coal mining.

Data are compiled in this report on the total remaining coal resource of the United States, the production of coal in 1970 by mining method, sulfur content, ash content, and BTU value. Production of all coal has been projected to 1976. Projections have also been made in three sulfur categories: less than 1.0 percent, 1.0 to 2.0 percent, and 2.1 percent or more sulfur. The total remaining coal resource of the United States, as of December 31, 1970, is estimated at 1,576 billion tons, consisting of 693 billion tons of bituminous coal, 420 billion tons of subbituminous coal, 447 billion tons of lignite, and 16 billion tons of anthracite. TRANSPORTATION COSTS OF FOSSIL FUELS.
Interim rept.
Jun 71, 62p APTD-0714

Descriptors: (*Transportation, *Cost analysis), (*Fossil fuels, Transportation), Coal, Natural gas, Residual oils, Rail transportation, Waterway transportation, Statistical data.

The report delineates some of the important factors relating to the costs of transporting fossil fuels from regions of production to sites of consumption. The costs of shipping coal have been presented in a quantified fashion for selected producing area to areas of consumption. The costs of shipping residual fuel oil and natural gas from domestic and foreign sources to New York and San Francisco Standard Metropolitan Statistical Areas are also provided. The collected transportation data were stratified to determine the general effects stratification had upon transportation costs. Economics of haul for coal do exist for longer versus shorter distances, larger trainload versus smaller trainload sizes, and company-owned car ownership versus railroad car ownership. Most of the rates for the longer voyages for the tanker and barge transportation of residual oil also show economies of haul. (Author)

RESTRICTIONS ON THE USES OF COAL.
Jun 71, 61p APID-0717

Descriptors: (*Coal, Availability), (*Economic forecasting, Coal), Limiting, Coal constituents, Air pollution, Transportation, Coal preparation, Coal mining, Manpower, Safety.

Although the United States has virtually unlimited reserves of coal of all ranks, the future availability of domestic coals may be limited by factors which range from the inherent characteristics of the coal itself to the nation's capacity for producing and transporting a high grade product suitable for various end-use markets. In addition to coal's quality characteristics that may restrict its use in certain markets, other limiting factors such as manpower and transportation availability, and inadequate mine production and preparation and cleaning plant capacity are indirectly related to coal supply and availability. Each of these constraints were evaluated in this report and an attempt was made to show their quantitative effect upon the future consumption and use of coal. (Author)

Descriptors: (*Combustion chambers, *Exhaust emissions), (*Automobile engines, *Rankine cycle), Air pollution control equipment, Design criteria, Fuel systems, Fuel sprays, Flowmeters, Fans, Combustion control.
Identifiers: JP-5 fuels, Air fuel ratio.

A program has been initiated with the primary objective of applying modern analytical and experimental techniques to the design and demonstration of a low emission combustor for an automotive Rankine engine. The basic problem resolved by this program was the demonstration that a Rankine cycle combustor with a two million BTU per hr. heat release in a 1.33 cu. ft. volume operating on JP-5 fuel can meet the 1980 Advanced Automotive Power Systems emission level goals over a 100 to 1 heat release range at steady state or during rapid transients. The program has further demonstrated that the package size and power requirements of combustors need not be excessive. The novel fuel automization system assures that the fuels can be rapidly ignited in even the coldest weather and does not need warm up to maintain low emission as do the current spark ignition engines. The novel rotating cup has been shown to be essential for low emission control over the 100 to 1 heat release range. The precision air and fuel metering valves and controls have also been shown to be essential to maintain the low emissions over the 100 to 1 heat release range. (Author)

ORGANIC PESTICIDES AND PESTICIDE CONTAINERS. A STUDY OF THEIR DECONTAMINATION AND COMBUSTION,
Robert C. Putnam, Frank Ellison, Robert Protzmann, and John Hilovsky. 1971, 182p EPA-SW-21C-71
Contract EPA-CPE-69-140

Descriptors: (*Pesticides, *Waste disposal), Decontamination, Combustion, Containers, Oxidizers, Binders (Materials), Pyrolysis, Polyethylene, Environments, Pollution.

The problem of the disposal of waste pesticides is constantly increasing in acuteness with the diversification of their use and the growth of population. Their escape into the environment as a result of disposal practices must be controlled or prevented. Some waste pesticides are being stored until safe disposal methods are available; however, they cannot be accumulated indefinitely. The purpose of this project was to investigate methods of combustion applicable to disposal of pesticide

residues and their containers and to devise a means for their destruction that would keep environmental pollution to a minimum. Oxidizing agents and binders generally aided the destruction of pesticides; the combination of oxidants and petroleum oil binders was no more effective than the oil binders alone. By using polyethylene, which under heating or combustion conditions softens or degrades to products of lower molecular weight, the advantages of a liner and a binder were obtained with one material. A practical system was devised that consisted of burning the pesticide in a flattened polyethylene bag on or surrounded by other combustible material. Suggestions were made concerning an improved design of polyethylene container or liner to aid in carrying out the purpose of this investigation.

LARGE POWER PLANT EFFLUENT STUDY (LAPPES). VOLUME II. INSTRUMENTATION, PROCEDURES, AND DATA TABULATIONS (1967 AND 1969),
Francis A. Schiermeier. Nov 70, 347p APTD-0589
See also Volume I, PB-194 152. Released to the public Aug 1971.

Descriptors: (*Air pollution, *Combustion products), (*Electric power plants, Air pollution), (*Plumes, *Atmospheric motion), (*Sulfur dioxide, Air pollution), Tables (Data), Flue gases, Coal, Thermal power plants, Airborne detectors, Plume detection, Climatology, Meteorological data, Monitors, Pennsylvania.
Identifiers: *LAPPES (Large Power Plant Effluent Study), Large power plant effluent study, Indiana County (Pennsylvania).

The Large Power Plant Effluent Study (LAPPES) was initiated in Western Pennsylvania to evaluate the extent and effects of air pollution resulting from the largest complex of coal-burning generating stations in the United States. During 1967 and 1969 three series of LAPPES field experiments were conducted in an area surrounding the Keystone and Homer City Generating Stations; these experiments consisted of ground-based and airborne plume measurements supported by extensive meteorological observations. The topography and climatology of the generating station complex, the sulfur dioxide and meteorological monitoring equipment, and experimental procedures are described. Plant operational parameters and air quality and meteorological data collected during 1967 and 1969 are tabulated. (Author)

STUDY OF CHEMICALLY ACTIVE FLUID BED GASIFIER FOR REDUCTION OF SULPHUR OXIDE EMISSIONS.
Interim rept. 22 Jun 70-22 Feb 71,
J. W. T. Craig, G. L. Johnes, G. Moss, and J. H. Taylor. 22 Feb 71, 92p APTD-0721
Contract EPA-CPA-70-46

Descriptors: (*Fuel oil, *Desulfurization), (*Limestone, *Adsorbents), (*Air pollution, Sulfur dioxide), (*Sulfur inorganic compounds, *Adsorption), (*Fluidized bed processors, *Air pollution control equipment), (*Furnaces, Air pollution control equipment), Calcium oxides, Gasification, Vanadium, Materials recovery, Design, Combustion, Sodium, Iron, Gasification, Great Britain.
Identifiers: *Chemically Active Fluid Beds, *Air pollution control.

Exploratory work previously had shown a range of conditions under which sulfur is trapped by a shallow fluidized bed of lime in which fuel oil is undergoing partial combustion and gasification. The possibility of regenerating the lime had also been demonstrated. Thus the framework had been established for a process to eliminate SO2 pollution during combustion of high sulfur fuel oils. The process is designated CAFB for Chemically Active Fuel Bed. Batch reactor studies have extended the understanding of the Chemically Active Fluid Bed (CAFB) gasification process, the effects of its variables, and some of its limitations. A US fuel oil and one US limestone (BCR 1691) have been found to be satisfactory for the (CAFB) process, but a second US stone (BCR 1690) is not favorable. Two new batch reactors have been constructed. The adsorption of iron, vanadium, and sodium from the fuel by the limestone is mentioned. (Author)

DETERMINATION OF POLLUTIONAL POTENTIAL OF THE OGALLALA AQUIFER BY SALT WATER INJECTION,
Leslie G. McMillion, Sr., and Bruce W. Maxwell. Jun 70, 90p W71-11361, EPA-FWQA-16060-6/70

Descriptors: (*Ogallala aquifer, *Water pollution), (*Injection wells, Water pollution), (*Brines, *Waste disposal), Oklahoma.
Identifiers: *Liquid waste disposal, *Oil wastes.

Field studies were conducted to determine whether contamination of the Ogallala Aquifer could result from the current practice of injection of oil-field brines into the Glorieta Sandstone, which lies 500 to 1,000 feet below the Ogallala in Texas County, Oklahoma--the study area. The project was designed on the basis that for brines to move from the Glorieta to the Ogallala the potentiometric pressures in the Glorieta would have to be higher than water-level elevations of the Ogallala. Since the hydraulic characteristics of the Glorieta Sandstone were needed for determining this fluid relationship, a technique was developed for making aquifer tests in brine disposal wells. The technique has application in certain water resources investigations and in situations similar to that of this study. (Author)

LIGHT-CATALYZED CHLORINE OXIDATION FOR TREATMENT OF WASTEWATER,
Alfred F. Meiners. Sep 70, 118p W7111364, EPA-WQO17020-DUE-09/70
Contract DI-14-12-531
Paper copy available from GPO $1.00 as stock no. EP2.10:17020-DUE-09/70, 5501-0076.

Descriptors: (*Sewage treatment, *Photochemical reactions), (*Chlorination, Sewage treatment), Ultraviolet radiation, Performance evaluation.

The purpose of this research effort was to determine the feasibility of applying the light-catalyzed chlorine oxidation process to the treatment of effluents from secondary waste-treatment plants. Studies were made of wavelength effects and intensity-time effects for the purpose of selecting the most practical source of radiant energy for the process. A batch-recycle reactor was constructed to establish certain plant-design parameters for low-pressure mercury arcs under conditions which simulated large-scale operations. Cost estimates were made for the application of this process to a plant producing 10 million gallons of effluents per day. (Author)

USE OF FUNGI IMPERFECTI IN WASTE CONTROL.
Water pollution control research series,
Brooks D. Church, and Harold A. Nask. Jul 70, 91p W71-11365, FWPCA-12060-EHT-07/70
Paper copy available from GPO $1.00 as stock no. EP2.10:12060EHT/07/70.

Descriptors: (*Food processing, *Industrial waste treatment), (*Biodeterioration, Industrial waste treatment), Fungi.
Identifiers: *Corn processing, *Soybean processing.

Forty-five species of twelve genera of the Fungi Imperfecti were screened for those fungal candidates best able to rapidly convert soluble and suspended organic material (as measured by BOD) from corn- and soy food-processing waste streams to mycelial protein. Rapidly growing fungal strains were selected which were readily removed from the digested waste effluents by coarse filtration. Results on both soy and corn wastes gave definite encouragement that the commercial use of selected strains of certain species of Fungi Imperfecti to remove BOD in a readily harvested form is practical.

SECONDARY TREATMENT OF POTATO PROCESSING WASTES.
Water pollution control research series,
Kenneth A. Dostal. Jul 69, 68p W71-11369, EPA-WQO-12060-07/69
Paper copy available from GPO $0.65 as stock no. EP2.10:12060.07/69.

Descriptors: (*Food processing, *Industrial waste treatment), (*Lagoons (Pond's), Industrial waste treatment), Aerobic processes, Performance evaluation.
Identifiers: *Potatoe processing, *Water pollution control, Aeration ponds.

The report presents the results obtained from three pilot lagoons which were used to treat potato wastes during the period October 1966 through June 1968. One of the lagoons received primary clarifier effluent and was operated as a surface-aerated, aerobic unit. A second pond also received clarifier effluent but was operated as a completely-mixed, covered anaerobic unit. The effluent from the anaerobic unit was pumped into a third pond which contained a surface aerator. Hydraulic and organic loadings were varied to yield a spectrum of results. These results give feasible methods of secondary treatment of potato processing wastes.

EVALUATION OF STORM STANDBY TANKS, COLUMBUS, OHIO.
Water pollution control research series,
C.T. Lindblom. Mar 71, 120p W71-11371, EPA-WQO-11020-FAL-03/70
Paper copy available from GPO $1.50, as stock no. EPI.16:1102-FAL-03/71.

Descriptors: (*Combined sewers, *Water storage), Flow rate, Design.
Identifiers: *Storm water runoff, *Water pollution control.

The operation of three storm standby tanks contiguous to an intercepting sewer which serves both combined sewers and sanitary sewers was investigated to determine the effectiveness of the tanks in improving the quality of the waste water prior to its discharge into the river. Based on influent and effluent sampling data collected during the study period, storm standby tank facilities reduce significantly concentration of the solids and B.O.D. in the waste water in storm runoff periods. The extent of reduction is dependent to a major degree on the detention time of flow passing through the tanks. Improvement of dissolved oxygen resulting from passage of waste water through the tanks is very substantial, especially during periods when the dissolved oxygen content of the influent is low. NEW AND ULTRATHIN MEMBRANES FOR MUNICIPAL WASTEWATER TREATMENT BY REVERSE OSMOSIS.
Water pollution control research series,
L. T. Rozelle, E. M. Scattergood, B. R. Nelson, and J. E. Cadotte. Oct 70, 65p W71-11372, EPA-WQO-17020-EFA-10/70
Contract DI-14-12-587
Paper copy available from GPO $0.70 as stock no. EP2.10:17020-EFA-10/70, 5501-0073.

Descriptors: (*Sewage treatment, *Osmosis), (*Membranes, Osmosis), Cellulosic resins, Sulfonic acids, Performance evaluation.
Identifiers: *Reverse osmosis, *Tertiary sewage treatment.

A series of new and ultrathin membranes with thicknesses from 250 to 5000 angstroms and consisting of various polysaccharide mixed esters and ethers were tested on microporous supporting films for improved reverse osmosis treatment of municipal wastewaters. From the screening studies with secondary effluent, ultrathin membranes prepared from two polymers (out of a total of 44) looked very promising: cellulose methyl sulfonate O-propyl sulfonic acid (CMSOPSA) and cellulose acetate O-propyl sulfonic acid (CAOPSA). Long-term (150 hours) testing of the CMSOPSA membrane with secondary effluent resulted in an average water flux of 34 to 36 gfd over the last 100 hours, and rejections of 96 percent for total dissolved solids, 94 percent for ammonia, and 83 percent for total organic carbon. Preliminary membrane optimization studies showed that the reverse osmosis properties of these new membranes could be improved by closely controlling the polymer preparation procedures and the casting and annealing conditions. A preliminary economic analysis was conducted.

EFFECTS OF FUEL ADDITIVES ON AIR POLLUTANT EMISSIONS FROM DISTILLATE-OIL-FIRED FURNACES,
G. B. Martin, D. W. Pershing, and E. E. Berkau.
Jun 71, 91p AP-87
Paper copy available from GPO $0.50 as stock no. 5503-0021.

Descriptors: (*Air pollution, *Combustion products), (*Fuel additives, Air pollution), (*Fuel oil, Fuel additives), (*Furnaces, Air pollution), Particles, Nitrogen oxides, Oil burners, Tests, Evaluation.
Identifiers: *Air pollution control.

The available literature was surveyed, and samples of all known additives procured. Each additive was analyzed for elemental composition to provide a basis for testing. A standard screening procedure was established to test the effect of each additive on emissions from fuel oil combustion. Screening tests were carried out on all distillate soluble additives. The most promising additives were then subjected to a rigorous examination. Fuel additives are not a promising way of reducing air pollution from distillate oil combustion. A majority of the additives tested had no beneficial effects on air pollutant emissions; in fact, some additives even increased total particulate and NO (X) emissions. Several of the metal-containing additives, e.g., Ferrocene, CI-2, and Fuelco SO3, reduced total particulate emissions; however, the unknown toxicity of new emissions they create makes their use questionable. Further, there is evidence that for distillate oils, burner modifications are a more suitable route to air pollution control. (Author)

PLUME RISE FROM KEYSTONE PLANT.
Final rept.,
Betsy Woodward Proudfit. Dec 70, 90p
APTD-0727
Contract PH-86-68-94
Released to the public Aug 71.

Descriptors: (*Air pollution, *Combustion products), (*Electric power plants, Air pollution), (*Plumes, *Atmospheric motion), Sulfur dioxide, Temperature, Atmospheric concentration, Airborne detectors, Wind (Meteorology), Meteorological data, Pennsylvania.
Identifiers: *Keystone Generating Station, LAPPES (Large Power Plant Effluent Study), Air pollution detection, Indiana County (Pennsylvania).

An instrumented helicopter was used to obtain a record of temperatures and sulfur dioxide concentration in the plume from the Keystone Power Plant in western Pennsylvania. The records were then evaluated to determine plume heights under a variety of atmospheric conditions. To assist in determining the plume boundaries, a device was used which detected charged particles in the plume. The equipment and techniques used to obtain the data and the methods employed to reduce it are described. The data from ten flight days are presented. Included are general descriptions of each day, temperature soundings and plume heights and SO2 maximum concentrations obtained from traverses through the plume. Twenty cases from seven flight days were analyzed and evaluated. For the cases analyzed, the average wind speed varied from 4.8 to 12.5 meters per second and the stability from about 0.15 to 1.5 degrees C. per 100 meters.

OIL AVAILABILITY BY SULFUR LEVELS.

Aug 71, 282p* APTD-0731

Descriptors: (*Crude oil, Availability), (*Fuel oil, Availability), Surveys, Sulfur, Reserves, Refineries, Desulfurization, International trade, Bulk storage, Oil storage, Pollution.

Sulfur content of crude oil reserves, production, and selected refined products are presented by geographical areas. Crude oil reserves (as of December 31, 1969) and 1969 production were classified by sulfur content as were refinery receipts. Quantity and sulfur content of stocks and shipments of selected refinery products was determined; also tabulated was sulfur content of stocks held at bulk terminal storage facilities. Domestic and foreign desulfurization operations were tabulated and technology discussed. Pertinent data for reserves, production, refineries, and bulk terminals were incorporated into a computerized national energy data bank.

Identifiers: *Air pollution control, *Regional Air Pollution System Analysis, Implementation Air Pollution Planning Program.

A program is presented which had as its objectives the design, assembly and delivery of analytic tools to be used in regional and national air pollution planning and management. The Cost/Benefit model described here completes a set of computer programmed air pollution analysis tools previously conceived. The completed project combines the results of systems analysis with cost/benefit analysis. A description is given of the programmed Benefits Model Segment, a user's manual, and the results of a study which was conducted to illustrate the operation characteristics of the Cost/Benefit Model. The various component modules of the Implementation Planning program and the Benefits model segment are presented. Also included is a presentation of the model demonstration in the National Capitol Interstate control region.

TRACE MATERIALS IN WASTES DISPOSED TO COASTAL WATERS: FATES, MECHANISMS AND ECOLOGICAL GUIDANCE AND CONTROL,
Milton H. Feldman. Jul 70, 107p Working Paper-78 w71-11793, FWQA-16070-07/70

Descriptors: (*Marine biology, *Trace elements), (*Water pollution, *Ecology), Metabolism, Oceans, Coasts, Lead, Cyanides, Mercury, DDT, Metals, Algae, Toxicity, Seawater, Nutrients, Nitrogen, Phosphorus, Magnesium, Manganese, Reviews.
Identifiers: Eutrophication, *Water pollution effects (Plants), *Water pollution effects (Animals).

Wastes currently being discharged to the coastal waters of the United States include Trace organic contaminants (TC), trace elements (TE), and other trace materials (TM). Those TM dealt with included: (1) known violently noxious materials (Pb (+2), (CN)2 (-2), Hg (+2)); (2) materials which are biostimulatory to some species (cobalamin, iron chelates, thiamin, biotin, Mn, Mg; and (3) materials which are bioinhibitory for at least some species in various mechanisms (DDT, Se, Mn, Mg). A different view of the problem was taken in which ways of selecting the optimum organism to utilize a particular waste were preferred to methods of removing it conventionally. A thorough literature search revealed a significant lack of literature in waste breakdown for both qualitative and quantitative evaluation. It was concluded that further studies should be performed for each known trace material to determine: The mechanism whereby it is secluded; The metabolic threshold; The active level; The harmful level; The speciation requirements; The absolute rates in and out of the compartments of which coastal waters, sediments, chemical system phases, and biota may be considered as composed. Evaluations such as these were performed for DDT, and they must be performed for the known set of waste constituents before rational action to prevent damage to the oceans is possible.

ANALYSIS OF THE AVAILABILITY OF BITUMINOUS COAL IN THE APPALACHIAN REGION.

Jul 71, 77p APTD-0730

Descriptors: (*Bituminous coal, Economic surveys), Sulfur, Reserves, Coal mines, Statistical data, Commerce, Coke.
Identifiers: Applachian Region.

Operators of bituminous coal mines that produced 100,000 tons or more in 1967 in Alabama, eastern Kentucky, Maryland, Ohio, Pennsylvania, Tennessee, Virginia and West Virginia responded to a special questionnaire, or were personally contacted. A remaining reserve of 31.4 billion short tons of bituminous coal was reported as of December 31, 1967. At 1967 prices, 5.7 billion tons was reported as recoverable; an additional 7.7 billion tons could be recovered with a price increase up to and over $2.00 per ton. Of the reported recoverable reserve, 34 percent contains 1.0 percent or less sulfur. Reserves reported as captive accounted for 8 percent of the total remaining reserves; 40 percent was reported as commercially available on the open market. The remainder was reported as undifferentiated, neither captive nor commercial. Of the 266 million tons of coal reported produced in 1967, by the selected companies, about 43 percent was at a sulfur level of 1.0 percent or less. An additional 24 million tons, mostly high-quality coking coal, was exported. The balance of 44 million tons was used for other industrial purposes and retail sales. Coal analytical data are also provided. Differences in coal reserves estimates are discussed. (Author)

FEDERAL ASSISTANCE PROJECT METROPOLITAN DENVER SEWAGE DISPOSAL DISTRICT, NO. 1, OCTOBER 1969--FEBRUARY 1970,
Bob A. Hegg, and John R. Burgeson. Mar 71, 50p

Descriptors: (*Sewage treatment, *Sludge disposal), Colorado.
Identifiers: *Denver (Colorado).

The Metropolitan Denver Sewage Disposal District no. 1 (Metro Denver) plant was designed mainly as a secondary treatment facility (activated sludge) to treat wastes from the cities and sanitary districts in the Metropolitan Denver Area. The most significant problem areas at the Metro Denver plant, leading to the request for assistance, were the sludge handling and sludge disposal problems. The major sludge handling problem was processing the volume and type of waste activated sludge generated by the secondary treatment process employed at the plant. Operational changes in the secondary treatment process, training in conducting various control tests and data evaluation were the major tasks performed during the assistance project. These functions were coupled with various operational recommendations for both short term and long term plant operation and control.

INVESTIGATION OF THE REACTIVITIES OF LIMESTONE TO REMOVE SULFUR DIOXIDE FROM FLUE GAS,
J. D. Hatfield, Y. K. Kim, R. C. Mullins, and G. H. McClellan. 30 Jun 70, 156p* APTD-0699

Descriptors: (*Limestone, *Adsorbents), (*Sulfur dioxide, *Adsorption), (*Air pollution, Sulfur dioxide), (*Sulfation, Limestone), Mineral deposits, Comparison, Chemical reactivity, Reaction kinetics, Disproportionation, Calcines, Flue gases, Combustion, Roasting, Calcium oxides, Magnesium oxides, Injection.
Identifiers: *Air pollution control.

An investigation has been conducted, concerning the properties of a limestone that are important in determining its effectiveness when injected into a combustion chamber to decrease the emission of SO2 in the stack gas from burning sulfur-containing fuel in a power plant. To obtain this information, reactivities of thirty-five stones were measured and correlated with their mineralogical and crystallographic properties. Rates and capacities of sulfation were taken as measures of reactivity. The report is divided into three parts: reaction mechanisms and kinetics, properties of calcines and sulfated limestones, and evaluation of the reactivities of selected limestones toward SO2.

Identifiers: *Tidal rivers, *Water pollution models, *Columbia river, Thermal pollution, Finite element analysis.

The Columbia River from the Pacific Ocean to Bonneville Dam is treated as a series of two-dimensional finite elements in the formulation of a mathematical model of the system. Currents and stages are simulated along the river via an explicit solution of the one-dimensional equations of motion and continuity; two-dimensional conditions in the horizontal are approached by means of a branched network of connecting channels and junctions. Computed net velocities and stages are used as input to the advection-diffusion equation and solutions are obtained for any coupled (e.g., BOD-DO) or uncoupled, first order reaction, conservative and/or non-conservative substance. Emphasis is placed on obtaining a solution for temperature as the dependent variable. Allowance is made for input of meteorological variables and a stepwise heat budget computation is made in order to predict temperature conditions on an hourly basis. A discussion of some existing pollution models, numerical methods and error sources is given; computer programs and program notes are listed. (Author)

BACKGROUND INFORMATION FOR PROPOSED NEW-SOURCE PERFORMANCE STANDARDS: STEAM GENERATORS, INCINERATORS, PORTLAND CEMENT PLANTS, NITRIC ACID PLANTS, SULFURIC ACID PLANTS.

Aug 71, 61p* APTD-0711
Errata sheet inserted.

Descriptors: (*Industrial waste treatment, Standards), (*Air pollution, *Government policies), (*Standards, Air pollution), (*Chemical industry, Air pollution), (*Concrete plants, Air pollution), (*Boilers, Air pollution), (*Incinerators, Air pollution), Economic analysis, Regulations, Nitric acid, Sulfuric acid, Industrial plants, Particles, Combustion products, Nitrogen oxides, Sulfur dioxide.
Identifiers: *Air pollution control, Cement industry.

Background information is provided on the derivation of the proposed new-source performance standards and their economic impact on construction and operation. The purpose is for facilitating review and comment prior to promulgation of the standards. The performance standards were developed after consultation with plant owners and operators, appropriate advisory committees equipment designers, independent experts, and Federal departments and agencies. The promulgation of standards of performance for new stationary sources does not prevent state or local jurisdictions from adopting more stringent emission limitations for these same sources.

FLUID BED INCINERATION OF PETROLEUM REFINERY WASTES.
Water pollution control research series.

Mar 71, 125p W71-11794, EPA-WQO-12050-EKT-03/71
Grant FWPCA-WPRD-215-01-68
Paper copy available from GPO $1.50 as stock no. 5501-0052.

Descriptors: (*Refineries, *Waste disposal), (*Incinerators, Oils), Fluidized bed processors, Process charting, Design, Performance evaluation.
Identifiers: *Oil wastes, *Solid waste disposal.

The applicability of the fluid bed incineration process for the disposal of petroleum refinery generated spent caustic and oily sludge in a commercial scale unit has been demonstrated. Operating problems have been studied. Design and operating procedural changes are suggested. The major process limitation stems from the loss of bed fluidity due to high particle size growth rate. Particle size growth rate is directly proportional to the particle diameter and rate of dissolved solid material charged and inversely proportional to the mass of material in the bed. The average particle diameter can be controlled by collecting and continuously returning fine material to the bed, utilizing an effective attriting system, and limiting superficial space velocity to avoid elutriation of fines. EVALUATION OF A NEW ACID MINE DRAINAGE TREATMENT PROCESS.

Feb 71, 162p W71-11795, EPA-WQO-14010-DYI-02/71
Contract DI-14-12-529
Paper copy available from GPO $1.50 as stock no. 5501-0075.

Descriptors: (*Coal, *Combustion), (*Mine waters, *Water treatment), (*Desulfurization, Coal), Slags, Liquid metals, Electric power generation, Waste disposal, Utilization, Sulfur, Materials recovery.
Identifiers: *Mine wastes, *Water pollution control, *Mine acid drainage.

An economic and engineering evaluation of a submerged coal refuse combustion process to convert acid mine water (AMW) to potable water has been made. In this process coal refuse is burned in molten iron to supply energy for distillation or reverse osmosis, and the coal refuse sulfur is trapped in a slag for eventual recovery of sulfur. Laboratory experimentation was conducted on those areas which could profoundly affect the process. These areas were: A laboratory demonstration of slag desulfurization to produce sulfur, the evaluation of slag retention characteristics, slag capability for neutralizing AMW and determination of slag compositions having acceptable fluidities. Engineering studies show that the process has potential for supplying inexpensive energy for distillation and permits the recovery of sulfur so that distilled water is economically produced. CARBON COLUMN OPERATION IN WASTE WATER TREATMENT,
Christopher Vanier, and Chi Tien. Nov 70, 87p* W71-12038, EPA-WQO-17020-DZO-11/70

Descriptors: (*Sewage treatment, *Absorbers (Equipment)), (*Sewage filtration, Activated carbon treatment), (*Activated carbon treatment, *Computerized simulation), Columns (Process engineering), Adsorption, Computer programs, Backwashing, Flow rate, Mathematical models.

The Adsorption and filtration of waste water in an isothermal column of granular activated carbon has been mathematically modeled. Based on this model, a simulation program was prepared and coded in Fortran IV to be run on the IBM 360/50 level G compiler. A separate companion study was conducted on the filtration of a clay suspension in an activated carbon bed to provide a filtration rate equation. The equation so obtained was then assumed to represent the filtration rate equation of the waste water. Adsorption, then was considered to be controlled by a combination of liquid phase diffusion and intraparticle diffusion. These two phenomena were then approximated by a solid phase rate expression based upon Glueckauf's linear driving force. In addition to adsorption and filtrations, the effects of backwashing and regeneration were also included in the model. A newly developed algorithm was used for the numerical integration of the pertinent characteristic normal hyperbolic equations. The design of the program allowed a clear separation of calculation framework and column model. This separation was made to permit new discoveries and new theories to be adapted to the basic program with minimal difficulty. The incompleteness and uncertainty of current theories of the carbon contact process will almost certainly make the ease of adaption the most important feature of the program.

THE SOIL FILTER: A TREATMENT PROCESS FOR REMOVAL OF ODOROUS GASES.
Final rept.,
Dale A. Carlson, Robert Gumerman, and Curtis Leiser. Feb 70, 107p* W71-12039, EPA-WQO-17020-02/70
Grant FWPCA-WP-00883-03

Descriptors: (*Odor control, *Sewage treatment), (*Gas filters, *Soils), (*Hydrogen sulfide, *Adsorption), (*Thiols, Adsorption), Filtration, Moisture content, Materials recovery, Design criteria, Methane, Microorganisms, Loams, Clay soils, Sand filters, Fluid flow, Surface chemistry.
Identifiers: *Soil filters.

While the removal of odors emitted from various locations in sewage collection systems by pumping the gases through a soil filter has been well documented, the actual removal mechanisms remained to be established. The experiments performed involved variation of the average particle size and moisture content of the filters, and further experiments were also performed with sterile soil. It was determined that the soil filter was particularly effective in the removal of polar gases such as hydrogen sulfide and methyl mercaptan from waste streams. At hydrogen sulfide concentrations in excess of 100 mg/l the biological removal mechanisms were not significantly operative, and chemical removal mechanisms appeared to prevail. In dry sterile soil, adsorption coupled with surface catalysis reactions were found to be the predominant mechanisms for removal. For low gas concentrations (less than 100 mg/l H2S) the biological removal mechanisms were predominant and wet soil was preferred. Moist loam soil was able to remove 100% of a 775 mg/l mercaptan, in quantities of .85 liter per cu. ft. of soil/week. Methane was not removed in any case. With proper design and care, soil filters operated in a range favorable for the growth of microorganisms can be operated indefinitely.

Identifiers: *Air pollution detection, Soiling index.

All known sensing techniques available for application to automatic, continuous measurement of the rate of particulate mass emissions from large fossil-fuel combustion facilities are discussed. Emphasis is on the measurement of particle mass rather than other particle parameters, and emissions downstream rather than upstream of any control equipment. Although sensors for permanently-installed effluent monitoring systems are emphasized, much of the information is also applicable to portable and research instruments. Brief surveys are presented of all known particle sensing techniques. A brief discussion of the principle of operation is followed by a list of inherent and practical strengths and weaknesses of each technique. A list of commercial manufacturers of related equipment and a list of 1,352 references helps the reader who needs more information on a specific technique. Recommendations for further development outline areas of needed improvement for techniques which offer some promise for stack monitoring. The introduction includes general comments which apply to all sensing techniques, and ranks all techniques in order of present apparent potential. A separate chapter summarizes typical conditions found in large fossil-fuel effluent gases and sets the necessary specifications

for a particulate monitoring instrument which operates in an effluent gas atmosphere.

Identifiers: *Air pollution detection, Soiling index.

All known sensing techniques available for application to automatic, continuous measurement of the rate of particulate mass emissions from large fossil-fuel combustion facilities are discussed. The measurement of particle mass rather than other particle parameters is emphasized. Although the report emphasizes permanently-installed effluent monitoring systems, much of the information is also applicable to portable and research instruments. Detailed discussions of particle sensing techniques as applied to emissions monitoring are presented. Each discussion analyzes possible problems and their solutions, in using the technique for emission monitoring, and includes an analysis of what particulate parameter the technique sees, how closely the measurement correlates with particulate mass, inherent measurement errors, practical design problems and possible solutions, the potential sensitivity and response of each technique, the complexity of the potential instrument, the present state of development of the technique, and recommendations for further development. Each discussion includes a complete bibliography. A separate chapter describes typical conditions found in large fossil-fuel effluent gases in detail. Another separate chapter summarizes many of the problems encountered in the design of sampling probes required by most of the particle sensing techniques.

THE ECONOMICS OF WATER SUPPLY AND QUALITY,
Robert Dorfman, Harold Thomas, Jr., and Henry D. Jacoby. Feb 71, 44p W71-12333, EPA-WQO-16110-DTF-12/71
Paper copy available from GPO $0.50 as stock no. 5501-0070.

Descriptors: (*Water supply, Economic analysis), (*Water quality, Economic analysis), Rivers, Stream flow, Mathematical models, Water resources, Wastes, Regional planning, Simulation, Droughts, Estuaries, Cost estimates, Flow measurement.

Research has been directed to a series of problems in water resource management. One pair of projects has focused on problems of water supply planning under uncertainty, and improved methods of analysis for planning have been developed. A set of four research efforts has been devoted to problems of water quality management, with special attention given to the decisions faced by municipalities and regional authorities. New conceptual models of quality management institutions have been proposed, and the conceptual framework has been applied to several sample river basins. A third focus has been on the development of improved computing methods for analysis of river basins. Two projects have contributed new analytical models for preliminary screening of river basin designs. Special attention has been directed to the analysis of flow augmentation for water quality management. Finally, research has been carried out on the use of regional analysis in water resource planning. A static regional input-output model has also been developed that can analyze the interrelations between regional growth and efforts at water quality control. (Author)

STUDY OF DECOMPOSED METHANOL AS A LOW EMISSION FUEL.
Final rept.,
R. K. Pefley, M. A. Saad, M. A. Sweeney, J. D. Kilgroe, and R. E. Fitch. 30 Apr 71, 106p*

Descriptors: (*Air pollution, *Exhaust gases), (*Automotive fuels, *Methyl alcohol), (*Spark ignition engines, Air pollution), (*Catalysis, Methyl alcohols), Design criteria, Combustion, Decomposition reactions, Gas chromatography, Aldehydes, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Automobile engines.
Identifiers: *Automobile exhaust, *Air pollution control.

Tests were run on a CFR engine to study the feasibility of using dissociated methanol as an automotive fuel. Using simulated decomposed methanol, in the range of 0 to 100%, exhaust emissions were analyzed by gas chromatography and IR sensors, and their trends were determined as functions of compression ratio, air-fuel ratio, spark advance, intake manifold temperature and degree of dissociation of the fuel. The exhaust emission results were also related to engine performance in terms of indicated horsepower and indicated thermal efficiency. A summary of the experimental program and considerations of methods of using exhaust energy for decomposing methanol are presented. (Author)

Contract PH-22-68-11

Descriptors: (*Air pollution, Sulfur dioxide), (*Sulfur dioxide, *Adsorption), (*Calcium oxides, *Adsorbents), (*Tin alloys, Adsorbents), Fused salts, Nitrates, Corrosion, Chemical reactions, Eutectics, Regeneration (Engineering), Lead containing alloys, Scrubbers.
Identifiers: *Air pollution control, *Waste gas recovery.

A laboratory investigation has been made on those candidate systems for SO2 removal that were developed during a literature search. Emphasis in the investigation was placed on the definition of those parameters which would allow a more definitive engineering evaluation. Of the four candidate systems recommended previously, the nonregenerable limestone-molten nitrate system, and the adduct or complex-forming molten nitrate system have been rejected. The remaining candidate systems - the molten nitrate-calcium oxide system and the tin-lead alloy system-have been investigated in some detail. Comparison studies of the various reactive oxides dissolved or suspended in the molten nitrate solvents have shown that the best reactant is calcium oxide. The complete results of this experimental program are presented in the report.

Descriptors: (*Air pollution, *Regional planning), Strategy, Data processing, Standards, Cost estimates, Economic analysis, Atmospheric motion, Atmospheric diffusion, Land use, Benefit cost analysis, Missouri.
Identifiers: Air pollution control, *Air Quality Implementation Planning Program, Saint Louis (Missouri).

The report addresses two major questions in air pollution control: What emission control strategy should be used by the states to achieve their air quality goals. How can air quality effects of changing land use patterns to predicted. A comparison of three alternate emission control strategies as applied to the St. Louis Air Quality Control Region, is presented. The strategies are: A conventional set of emission source-category standards. A rollback strategy, and A least-cost strategy. Study results include regional costs, air quality achieved, emission reductions, plots of pollutant concentration levels (isopleths), and a measure of benefit. The report also presents a description and brief analysis of a simple procedure by which a diffusion model can be used to predict the (air Quality) consequences of shifting land use, without incurring the expense of continually re-running the entire model.

SENSITIVITY ANALYSIS OF SELECTED AIR QUALITY IMPLEMENTATION PLANNING PROGRAM INPUT PARAMETERS,
W. D. Dickerson. Jul 71, 94p 11130-W003-R0-00 APTD-0726
Contract PH-22-68-60

Descriptors: (*Air pollution, *Regional planning), Strategy, Data processing, Cost estimates, Computer programming, Economic analysis, Sensitivity, Atmospheric motion, Atmospheric diffusion, Air pollution control equipment.
Identifiers: *Air Quality Implementation Planning Program, Air pollution control.

A major problem in the analysis of regional air pollution abatement (control) strategies is the collection and verification of an adequate data base. If computer programs (such as the Air Quality Implementation Planning Program (IPP)) are used, the scope of the data base must be expanded to include: Effective stack parameters and Regional cost data as an aid in the definition and use of these parameters, their sensitivity, with respect to pollutant concentration values and/or annual device cost are determined. The study utilizes the atmospheric diffusion model and the control cost model of the IPP. Since these models use generally accepted techniques, and have been verified through extensive use, the study conclusions and recommendations are generally applicable. Sensitivity analysis of the effective stack height parameters for individual sources is presented. Sensitivity analysis of the regional cost parameters with respect to the annual control cost of each physical device available in the IPP control cost model is also given.

Identifiers: Water pollution control, Tertiary sewage treatment.

Two new types of resins were subjected to laboratory evaluations of their technical and economic feasibility for use in phosphate removal. Multivalent metal derivatives of sulfonic acid resins were found to have good phosphorus capacities. The Iron (III) form of Amberlite 200 strong acid cation exchange resin, for example, exhibited capacities of up to 9.5 mg P/ml of wet resin, and in tests with secondary effluent, a 2.7 mg P/ml capacity was obtained. Exhausted resin was easily regenerable with dilute ferric chloride solution, and after ten exhaustion-regeneration cycles were performed on one sample, no detectable loss of phosphorus capacity was observed. The iron and phosphorus removed from the wastewater and concentrated in the waste brine were subsequently removed from the waste brine by lime addition and settling. A thorough cost analysis including both fixed construction costs as well as operation and maintenance costs, established the price of wastewater treatment by this method as 34.38 cents/gal. (Author)

Descriptors: (*Sludge, Chemical indicators), (*Activated sludge process, *Biomass), (*Deoxyribonucleic acids, *Chemical indicators), Sewage treatment, Measurement, Colorimetric analysis, Spectroscopic analysis, Ultrasonic radiation, Degradation, Cells (Biology).
Identifiers: Lysis.

Experiments were conducted on various activated sludge samples over a span of several months to determine the feasibility of using cell DNA as an estimate of sludge biomass. These investigations demonstrated that free DNA released into a solution of viable microorganisms by lysis of cells was rapidly degraded. Therefore, DNA obtained from such cultures would effectively be DNA from viable organisms. Crude DNA was extracted from activated sludge by rupturing the cells by Sonication and centrifuging the sonicated sludge, heating at 70C to pasteurize the supernatant, and centrifuging again. Estimation of cell population was made by assuming the weight of one cell to be 1 x 10 to the -9th mg, and the DNA content of organic matter to be about 4% of the total weight of the organic matter. Population sizes based on DNA analyses were checked by using the MPN method. Values obtained were similar to values obtained with other methods.

MOTOR VEHICLE ASSEMBLY LINE TESTING.
Final rept.

Aug 70, 91p* APTD-0718
Contract CPA-70-147

Descriptors: (*Air pollution, *Exhaust gases), (*Automotive industry, *Quality assurance), Assembly lines, Motor vehicles, Tests, Carbon monoxide, Hydrocarbons, Monitors, Standards, Government policies, Cost estimates, Automobile engines, Acceptability, Statistical quality control.
Identifiers: *Automobile exhaust.

The problem addressed in the report concerns the control of emissions from motor vehicles and particularly the actions which may be taken before these motor vehicles are released by the manufacturers to the public. NAPCA exerts its main point of control at the prototype stage, by issuing certificates for engine prototypes which pass certain criteria when subjected to a standard test procedure. The major requirements are on the level of carbon monoxide (CO) and hydrocarbons (HC) in the exhaust. The Secretary of Health, Education and Welfare has been authorized to test new vehicles or engines being manufactured to

determine if they are in fact constructed in all material respects substantially the same as the certified vehicle or engine. The study has been conducted to assemble meaningful information concerning motor vehicle assembly line testing for assisting policymakers in planning courses of action. Assembly line testing is herein projected as a program in quality control and assurance having two essential parts: the control and assurance program carried out by the manufactureres and the audit and monitoring function carried out by NAPCA. The planning, the development, and the implementation of both parts of the projected program are presented.

AN ECONOMIC MODEL SYSTEM FOR THE ASSESSMENT OF EFFECTS OF AIR POLLUTION ABATEMENT. VOLUME I. THE OAP ECONOMIC MODEL SYSTEM DEVELOPMENT AND DEMONSTRATION.
Final rept.

15 May 71, 301p* APTD-0751
Contract EPA-APCO-68-04-0039

Descriptors: (*Air pollution, *Economic models), Abatement, Cost estimates, Benefit cost analysis, Economic analysis, Taxes, Industries, Strategy, Unemployment.
Identifiers: *Air pollution control, *Cost sharing, *Regional Air Pollution Systems Analysis, Air Quality Control Regions.

The report presents a summary of the development, demonstration, and assessment of an economic model as an operational, analytical tool for abatement policy assessment. This economic model which was initiated as part of the Regional Air Pollution Analysis Program focused on the regional economies of the various Air Quality Control Regions. Thus it will be useful for assessment of control strategies at the regional level, where most of the implementation plans are prepared. There has been an increased focus in the model system toward the assessment of interregional and national economic effects. However, this system is still a regional economic system with limited capabilities to measure the interregional and national effects.

GOVERNMENTAL APPROACHES TO AIR POLLUTION CONTROL. A COMPENDIUM AND ANNOTATED BIBLIOGRAPHY,
Robert Witherspoon, John Hoicka, Terry Trumbull, and Don Infeld. 15 Jul 71, 560p* APTD-0749
Contract EHS-70-126

Descriptors: (*Air pollution, Government policies), (*Government policies, *Project planning), Legislation, Standards, National government, Bibliographies, Law enforcement, Sources, Strategy, Litigation, Taxes, Depreciation, Land use, Cost estimates, Economic analysis, Industries, Abatement.
Identifiers: *Air pollution control, Tax incentives, Clean Air Act 1971, Air pollution standards, *Cost sharing.

A study is presented consisting of a compilation of information to be used for evaluation of present programs and development of new approaches to air pollution control. The study begins with the description and analysis of federal legislation with particular reference to the Clean Air Act. Federal experience with voluntary compliance is reviewed. The experience with emission standards is reviewed and analyzed. A review is presented of variour land use controls to improve the dispersion of pollution from stationary sources and to reduce exposure to pollutants. The role that private legal action may play in the control of pollution is reviewed. Information is presented on the concept of cost sharing and such measures as accelerated depreciation, investment tax-credits and tax exemptions. The use of economic incentives making it profitable for a firm to introduce measures for pollution control and, the possibilities of requiring polluters to pay a charge for which they are responsible are reviewed. The system for the control of air pollution in use in South Wales is described and analyzed. Finally, an assessment of the above approaches based upon the evaluation criteria which were developed in the course of the project is discussed.

Identifiers: *Implementation Air Pollution Planning Program, *Air pollution control, Cincinnati (Ohio), Saint Louis (Missouri), Air pollution standards.

The report describes a study of certain applications of the Implementation Planning Program (IPP), undertaken as a part of Phase III of the Regional Air Pollution Analysis Project. The Implementation Planning Program is an air resource management planning tool which includes mathematical models representing the atmospheric diffusion of pollutants, the cost and effectiveness of pollution control measures, and the potential air quality impact of air pollution control strategies upon which control legislation may be based. The following objectives are examined here: Estimation of the demand for control measures generated by the need to meet the requirements of the Clean Air Act, as amended; Examination of the emission standards which were used in the Cost of Clean Air Report of the Clean Air Act, and to determine if the assumption that these emission standards will achieve air quality standards is valid; Observation of the operational data requirements of an IPP type analysis, to determine whether or not these requirements may be relaxed and the corresponding data collection problems reduced. Identifiers: *Air pollution control, Cement industry.

A program on particulate air pollution from stationary sources in the continental United States was conducted. The specific objective of the study was to identify, characterize, and, to the extent possible, quantify the particulate air pollution problem. Information was to be assembled and analyzed on the kind and magnitude of specific sources, and the status of current control practices. The resultant information was to be used to identify deficiencies in current knowledge regarding the nature of important particulate pollution sources, and to provide requisite handbook data for the design and application of control devices. The results of the study are presented. (Author)

FIELD INVESTIGATION OF SULFUR DIOXIDE WASHOUT FROM THE PLUME OF A LARGE COAL-FIRED POWER PLANT BY NATURAL PRECIPITATION.
Final rept.,
J. M. Hales, J. M. Thorp, and M. A. Wolf. Mar 71, 217p APTD-0739
Contract CPA-22-69-150

Descriptors: (*Air pollution, *Sulfur dioxide), (*Precipitation (Meteorology), Air pollution), Rainfall, Snowfall, Solubility, pH, Electric power plants, Cleaning, Monitors, Sulfates, Plumes, Flue gases, Atmospheric condensation.
Identifiers: *Precipitation washout, LAPPES (Large Power Plant Effluent Study).

An experimental investigation was conducted to measure the sulfur dioxide washout by natural precipitation from the plume of a large, coal-fired plant. The field investigation extended over three one-month periods in the vicinity of the Keystone Generation Station where 11 to 23 tons of sulfur dioxide, depending on power output, were released hourly from two 800 feet stacks. The primary objective of the study was to assess the effectiveness of precipitation washout as a mechanism for removing sulfur compounds from the plume of the keystone plant. A secondary objective of the study was to evaluate the relative importance of various interractions and atmospheric variables.

Paper copy available from GPO $1.25 as stock no. 5501-0101.

Descriptors: (*Mine waters, *Neutralization), (*Coal mines, Mine waters), (*Sludge disposal, Mine waters), (*Dewatering, *Sludge), (*Water pollution, Mine waters), Calcium oxides, Waste disposal, Materials handling, Magnetic separators, Carbonation, Dewatering, Filtration, Precipitation (Chemistry), Coagulation, Aluminum, Contaminants, Magnesium, Concentrating.
Identifiers: Magnetic precipitation, *Mine acid drainage, *Water pollution control.

Bench scale batch experiments were performed on sludges obtained from line neutralization of coal mine drainage in an attempt to alleviate present problems in sludge handling and disposal. Tests were of an exploratory nature and did not afford sufficient data for cost analyses. Ferro Magnetic sludge densification, filter aids, coagulant aids, heating, freeze drying, and coprecipitation of calcium carbonate through addition of CO2 were tested. Of these, freeze drying, CO2 addition, and ferro magnetic treatment were shown to be feasible alternatives to present disposal methods. Each of these methods resulted in settled sludge volume reducation of approximately 90% and increases in sludge solids contents of from 0.5 to about 5% after 30 min. settling periods. The ferro magnetic process has the advantages of possible recovery of a useful product, and elimination of costly settling lagoons, but is very sensitive to aluminum and requires a considerable amount of heat. Sludge freezing is the simplest conceptual approach and is

apparently effective for any lime produced sludge. The CO2 addition method offers the possibility of partial recovery and recycling of both CaO and CO2 through sludge calcination.

Paper copy available from GPO $1.25 as stock no. 5501-0096.

Descriptors: (*Mine waters, *Neutralizing), (*Water pollution, Mine waters), (*Sludge disposal, Mine waters), (*Dewatering, *Sludge), (*Coal mines, Mine waters), Filtration, Calcium oxides, Vacuum filtration, Precipitation (Chemistry), Sedimentation, Cost estimates, Limestone.
Identifiers: *Water pollution control, *Mine acid drainage.

A two year study was conducted at 4 locations in Pennsylvania to test the effect of various alkalies and filter aids on rotary vacuum precoat filtration for dewatering of lime neutralization sludge. The process consisted of neutralization, aeration, sedimentation and filtration. Alkalies investigated were limestone, limestone with hydrated lime, calcined magnesite, partially and fully calcined dolomite, and hydrated lime. Filter aids tested included Hyflo, Super-Cel, and Celite 501, 503, and 545. Results from the first three locations indicated limestone and hydrated lime were preferred alkalies and Celite 501 the preferred filter aid. At the 4th site a 27 run factorial experiment investigating the effect of flow rate, limestone feed level, aeration level, and sludge recirculation level on equipment operation and process cost was conducted. Sludge solids content, filtration rate, and sludge recirculation were found to be significant variables affecting process cost. Estimated operating costs for a 1.5 MGD treatment plant using lime neutralization were $1.16/1000 gallons treated or $8.02 per 100 lbs of acidity treated.

Descriptors: (*Phosphate deposites, *Materials recovery), (*Lightweight aggregates, *Phosphates), (*Mining, *Industrial waste treatment), Clays, Pelleting, Lightweight concretes, Slurries, Spoil, Dewatering, Fluidized bed processors, Kilns.
Identifiers: *Phosphate mining, *Phosphate rock slime, *Solid waste disposal.

Phosphate slimes have been produced by the Florida phosphate mining industry at the rate millions of cubic yards per year and the volume is increasing. The water retentive characteristics of the clays which are mined with the rock are such that there is more volume of phosphate slime to dispose of than there was actual rock mined. Small scale tests of the slimes were made to assess the feasibility of their use as building materials. A process was developed and demonstrated to be capable of producing a pelletized, light-weight aggregate, and finally a light-weight concrete from the slimes. The four major processing steps: pumping of clay slurries of 3 to 30% solids; slime drying in a fluid bed dryer; pelletizing the dried product and kilning the product to a suitable aggregate, were investigated in batch and suitable equipment was selected. Aggretage production could use up to 6-8 million tons of clay solids annually, releasing up to 5 billion gallons of water to the environment.

Descriptors: (*Chemical removal (Sewage treatment), *Phosphates), (*Sewage treatment, Phosphates), (*Pickling compositions, Sewage treatment), (*Phenols, Chemical removal (Sewage treatment)), Activated sludge process, Aeration, Precipitation (Chemistry), Centrifuging, Pilot plants, Feasibility, Trickling filters, Industrial wastes, Iron chlorides, Design criteria, Waste disposal.
Identifiers: Liquid waste disposal.

Over 50 experiments were performed on various wastewater treatment processes at a 200 gpm facility over a 20 month period. Major processes tested included chemical pre-treatment, activated sludge, plastic media trickling filters, deep tank aeration, and activated sludge disposal. Trickling filters were determined to be unsuitable, and the decision was made to design the full scale plant as an activated sludge plant that could be arranged in both the conventional and step feed process variations. The plant design should include deep tank aeration, and phosphate removal by injection of steel pickling liquor. Sludge disposal units investigated included vacuum filtration, centrifugation and filter pressing, but further research was deemed necessary before the selection of a single unit. 87% phenol reduction was achieved in the biological oxidation process, somewhat below the 97% removal required. This lower removal percentage indicated the necessity of further investigations.

Identifiers: *Reverse osmosis, *Tertiary sewage treatment, *Tubular membranes.

A reverse osmosis study with a threefold objective was conducted. Tubular membranes prepared from trans esterified cellulose acetate were compared with membranes made from commercially available cellulose acetate (control). Next an evaluation was conducted of the in-situ regenerable membrane reverse osmosis design on wastewater. Finally the membranes were subjected to carbon treated secondary effluents, primary effluents, and concentrated primary effluents. Results showed that the modified tubular membranes produced fluxes slightly greater than the control membranes, while in-situ regenerable membranes produced fluxes significantly below those obtained with tubular units. On carbon treated secondary effluents, modified tubular membranes produced an overall average product water flux of 15 gfd, compared to 10 gfd for the control. Initial levels were 15 and 25 gfd for the control and the modified membranes respectively, and these fluxes could be maintained by cleaning every 10 days with an enzyme presoak. Flux for the concentrated primary effluent (9 times the solids in primary effluent) stabilized at 4 to 5 gfd. Removal of wastewater constituents remained nearly constant at 90 to 100% for all three feeds, thus establishing the technical feasibility.

Identifiers: *Water pollution control.

Water borne wastes generated in the electroplating and metal finishing industry include: Rinse waters from plating, cleaning, and other surface finishing operations; Concentrated plating and finishing baths that are accidentally or intentionally discharged; Wastes from plant or equipment clean up; Sludges, filter cakes, etc.; Regenerants from ion exchange units; and Vent scrubber waters. Control measures discussed include in-plant control measures for waste reduction, as well as chemical, physical, and biological detoxification techniques for the various waters to be treated. The methods presented were developed for use by the large scale manufacturing operations and are now presented for the benefit of the small operator. Evaluation and cost estimation of these techniques as applied to smaller operations will be a major objective of investigatuons in subsequent phases of the program.

Contract EPA-WQO-14-12-550
Paper copy available from GPO $1.25 as stock no. 5501-0053.

Descriptors: (*Sewers, *Water influx), (*Sanitary engineering, Sewers), Manuals, Construction, Ground water, Sources, Fluid infiltration, Sewer pipes, Inspection, Storm sewers, Combined sewers, Sanitary sewers, Surface water runoff, Joints (Junctions), Design standards, Legislation, Cost estimates.

The manual is intended to serve as a guide to officials of local public agencies in evaluating sewer construction practices and in making field surveys of infiltration of ground waters and inflows from various sources. Guidelines are also presented for making economic analyses of the cost of excessive

infiltration and inflow, and for instituting corrective action. The problem is especially serious in the case of sanitary sewer systems in urban areas. Such systems are designed to carry only sanitary wastes, and a reasonable standard allowance is made for unavoidable entry of ground and surface waters. The illegal connection of roof leaders and foundation drains to sanitary sewer systems is the principal source of inflow. Improvements in inspection of construction and testing of completed sewer lines will promote the use of better materials and good construction practices. The use of air for infiltration testing and water for exfiltration testing is described. Exerpts from sewer control legislation are given. Codes, standards, specifications, and suggestions for sewer design, construction, inspection, repair and cleaning are discussed.

Identifiers: *Storm water runoff, San Francisco (California), Philadelphia (Pennsylvania), Cincinnati (Ohio).

A comprehensive mathematical model, capable of representing urban storm water runoff, has been developed to assist administrators and engineers in the planning, evaluation, and management of overflow abatement alternatives. Hydrographs and pollutographs (time varying quality concentrations or mass values) were generated for real storm events and systems from points of origin in real time sequence to points of disposal (including travel in receiving waters) with user options for intermediate storage and/or treatment facilities. Both combined and separate sewerage systems may be evaluated. Internal cost routines and receiving water quality output assisted in direct cost-benefit analysis of alternate programs of water quality enhancement. Demonstration and verification runs on selected catchments, varying in size from 180 to 5,400 acres, in four U.S. cities (approximately 20 storm events, total) were used to test and debug the model. The amount of pollutants released varied significantly with the real time occurrence, runoff intensity duration, prestorm history, land use, and maintenance. Storage-treatment combinations offered best cost-effectiveness ratios. (Author)

Descriptors: (*Respiratory diseases, *Nitrogen oxides), (*Air pollution, Nitrogen oxides), (*Public health, Air pollution), Tennessee, Epidemiology, Students, Adolescence, Lungs, Carbon monoxide, Respiration, Smoking, Population (Statistics).
Identifiers: Lung function tests, *Chattanooga (Tennessee).

The prevalence of chronic respiratory illness among 3,500 parents of high school students was studied in Chattanooga during the last quarter of 1970. Data were obtained from parents of students in four senior high schools, the neighborhoods of which had an exposure gradient to atmospheric nitrogen dioxide. The smoking habits of respondents were measured by the usual questionnaire techniques and by carbon monoxide concentrations in alveolar breath samples. Lung function was measured by one second forced expiratory volume (FEV) tests. Breath carbon monoxide levels were correlated with smoking habits, FEV and severity rating of chronic respiratory illness. FEV test results, corrected for height, age, sex, race, and CO, were singificantly lower among sample parents living in the high-nitrogen dioxide exposure area. Residents of that area did not show a significantly higher prevalence of chronic respiratory illness.

SURVEY OF COMMERCIALLY AVAILABLE CATALYST AND SORBENT MATERIALS.
Summary rept.,
R. H. Cherry, Jr., D. P. Moon, S. A. Rubin, and R. T. Niehoff. 17 Jul 69, 318p* APTD-0685
Contract PH-86-68-84

Descriptors: (*Catalysts, *Catalogs (Publications)), (*Adsorbents, Catalogs (Publications)), (*Air pollution control equipment, Chemical compounds), Tables (Data), Cost estimates, Chemical properties, Utilization, Computer programming, Data acquisition, Surveys, Physical properties.

An abbreviated catalog of catalyst, carrier and sorbent materials has been prepared from published and available manufacturer's information. Information on types, properties, usages, and costs has been collected. This information has been extracted and assembled for sorting, adjusting, arranging, and printing in logically meaningful arrays using a specially-developed Fortran IV catalog logic compatible with the CDC 6400 digital computer. The catalyst materials survey is useful in its present form for data storage and comparison, for screening, and as a decision-making tool. It cannot at present provide the guidelines or criteria for designing or choosing new catalyst-material candidates.

COMPUTER MAPPING OF COAL RESERVES BY SULFUR LEVEL: GENERAL DOCUMENTATION - PART I,
John C. Goodrich, and Howard T. Fisher. Apr 71, 198p APTD-0755
Contract CPA-70-16

Descriptors: (*Coal deposits, *Mapping), (*Sulfur dioxide, Coal deposits), (*Fossil fuels, Air pollution), Computer programming, Sulfur, Coal mines, Graphic methods, Data processing, Automatic mapping.
Identifiers: SYMAP computer program, GRID computer program, SYMVU computer program, Sulfur level, *Air pollution control.

A report is presented of a project which was designed to demonstrate the capabilities of the SYMAP Computer Mapping Program to display the sulfur levels of coal and the quantities of coal available at various sulfur levels. The report presents information in the following sections: SYMAP mapping techniques, GRID and SYMVU techniques, discussion of study area graphics, additional data considerations, and data handling routines. WATER MONITORING SYSTEM.
Terminal progress rept. 24 Jun 68-23 Dec 69.

3 Mar 70, 37p W71-13813, EPA-WQO-16030-ENR-03/70
Contract EPA-WQO-14-12-412

Descriptors: (*Water analysis, *Antigen antibody reactions), (*Insecticides, *Antibodies), (*Immunology, *Pesticides), (*DDT, Antibodies), (*Malathion, Antibodies), Antibody formation, Rabbits, Serum albumin, Aldehydes, Adsorption, Scintillation counters.
Identifiers: Acetic acid/bis (Chlorophenyl), Chlorine organic compounds, *Water pollution detection.

The feasibility of producing antibodies to DDT and Malathion derivatives was accomplished by immunizing animals with pesticide-protein complexes in which the protein carrier was derived from the species being immunized. DDA-rabbit serum albumin or Malathion anhydride-rabbit serum albumin conjugates were injected into rabbits in complete Freund's adjuvants at multiple intradermal sites, and antibody responses were encountered by the third or fourth injection. The results demonstrate that (1) it is possible to develop specific antibodies to two pesticide derivatives, DDA and Malathion anhydride (2) these antibodies are highly specific for each pesticide derivative; and (3) given enough time, the technical difficulties which have been encountered in utilizing these antibodies for the development of a highly sensitive immunoassay procedure could be resolved. Such a technique would offer investigators interested in pollution problems a simultaneously highly specific and highly sensitive method for detecting and measuring these pesticides, without the need for preliminary treatment of the samples being investigated. STOCHASTIC MODELING FOR WATER QUALITY MANAGEMENT.

Feb 71, 409p EPA-WQO-16090-DUH-02/71, W71-13824
Contract EPA-WQO-14-12-849
Paper copy available from GPO $3.00 as Stock Number 5501-0104.

Descriptors: (*Stream pollution, Mathematical models), (*Water pollution, Stochastic processes), Water quality, Biochemical oxygen demand, Dissolved gases, Sampling, Statistical analysis, Computer programs, Computerized simulation, Estuaries.
Identifiers: Ohio River, Potomac River.

Because water pollution is a stochastic process, water quality standards must incorporate variability. After reviewing previous deterministic models, the document generalized and extended earlier stochastic models. In particular, the project expanded and verified the Custer and Krutchkoff model. The specific objectives were to: Adapt the model to accept variable or random input loadings; Adapt the estuary model to treat segmented estuaries; Verify the adapted models with data supplied by WQO; Find a method for using data to estimate and predict the stochastic parameter delta. The objectives were successfully achieved and verification accomplished with data from the Ohio River and the Potomac Estuary. The report concluded that the extended Stochastic Model can handle load inputs, rate constants, velocity, temperature, benthal demands, land runoff, hydraulic parameters, geometry, and random pollution inputs. It can accurately predict the time-dependent mean concentration in a transient state condition or pseudo-steady state condition at any point in a stream or estuary. Further, the proportion of time that the BOD, DO and nitrogen concentrations will be above or below any given level can also be predicted accurately. Recommendations were made for further use and expansion of the model. (Author)

ANALYSIS AND ADVANCED DESIGN STUDY OF AN ELECTROMECHANICAL TRANSMISSION.

Apr 71, 261p 17220.00 APTD-0762
Contract EPA-EHSH-71-002

Descriptors: (*Automotive transmissions, Design criteria), (*Internal combustion engines, Hybrid propulsion), Motor vehicle drive systems, Automotive engineering, Electric motors, Electric generators, Lead acid batteries, Statistical data.
Identifiers: Electromechanical transmissions, Hybrid vehicular propulsion.

The report deals with the design and data analysis of a heat engine-battery hybrid propulsion system for vehicles. The first portion of the work performed is devoted to the following tasks: evaluation of the performance of the Electromechanical Transmission (EMT) operating on a dynamometer; performance of engineering trade-off studies on the power conditioning units of the Speeder (generator) and Torquer (traction motor) subsystems and presentation of up-graded design criteria; assessment of the performance of the Speeder and Torquer machines and the presentation of design criteria for advanced versions of both machines; development of advanced operational concepts such as start-up techniques and means for up-grading the transfer of the Torquer system between the motor and generator operating states; development of analytic models of Torquer system operation and use of these models to assess the effect of design parameters. The second portion of the study was intended to provide operational data on the performance of an internal combustion engine when used within the context of a hybrid power train. (Author)

Descriptors: (*Coal mining, *Materials recovery), (*Coal mines, Water pollution), (*Water pollution, *Mine waters), (*Desulfurization, *Pyrite), Spoil, Feasibility, Sulfur, Limestone, Chemical reactors, Hydrogen sulfide, Sulfur dioxide, Economic analysis, Cost estimates, Pelleting, Chemical engineering, Gasification, Sulfide minerals.
Identifiers: *Water pollution control, *Coal mine refuse, Claus process, Mine acid drainage.

During coal preparation, a coal refuse of no commercial value is produced and discarded in piles. As rainfall percolates through the piles, acid waters are formed. A feasibility study has been performed on a process producing sulfur from such coal refuse. In this process, limestone and coal refuse are ground, pelletized, and preheated before entering a desulfurizing shaft reactor where a hard, fired ash pellet and an H2S-SO2 bearing offgas are produced. After sulfur, tar, and other gases are removed, the resulting H2S-SO2 gas proceeds to a conventional sulfur recovery plant. Experimental results and economics of this study indicate that the process is a profitable means of minimizing coal refuse pile water pollution. For a sulfur and ash pellet selling price of $20 and $1.50/ton respectively, it is estimated that a coal producer will have a before tax return on investment up to 53 percent for a one MM ton/year plant utilizing an eight percent sulfur refuse. Paper copy available from GPO $0.50 as stock no. 5501-0069.

Descriptors: (*Water pollution, Oils), (*Materials recovery, *Oils), (*Separators, Water pollution), Vortices, Vacuum apparatus, Feasibility, Design criteria, Ocean waves, Pumping, Coanda effect, Performance evaluation, Field tests, Emulsions.
Identifiers: *Oil pollution, *Oil pollution recovery, Oil slicks.

Studies were conducted to determine the feasibility of a concept for recovery of floating oil slicks which utilizes a pump induced vortex and a vacuum suction or Coanda nozzle. The apparatus used for developmental experimentation comprised a pumping system for vortex production, a large water basin, a flapper type wave generator, and several configurations of the experimental assembly. The range of influence was smaller than was anticipated. Approximately a 2-foot influence diameter was achieved for the maximum strength vortex generated in this apparatus. Extrapolation of measured performance data showed that a 1/8-inch thick slick could be recovered at the rate of 960 gallons per hour. Experiments with and without a variety of oils showed that enhanced oil recovery rates with the vortex was due entirely to the surface current generated by the vortex. This effect was found to improve oil recovery by a factor of 7.9 above the rates achieved with a suction nozzle alone. The surface position of the vortex cavity was found to be sensitive to surface waves. The cavity moved in a circular path within three vortex cavity radii of the still water cavity location as a wave passed through the assembly. Tests with a Coanda nozzle (a fluid attachment eductor) showed improved performance in surface waves. However, the recovered oil-water mixture was highly emulsified. (Author)

Identifiers: *Water pollution effects (Plants).

Deicing agents for removal of ice and snow from highways and streets are essential to wintertime road maintenance in most areas of the U.S. Due to the ever-increasing use of highway deicing materials, there has been growing concern as to environmental effects resulting from these practices. The state-of-the-art report critically reviews the available information on methods, equipment and materials used for snow and ice removal; chlorides found in rainfall and municipal sewage during the winter; salt runoff from streets and highways; deicing compounds found in surface streams, public water supplies, groundwater, farm ponds and lakes; special additives incorporated into deicing agents; vehicular corrosion and deterioration of highway structures and pavements; and effects on roadside soils, vegetation and trees. Highway deicing can cause injury and damage across a wide environmental spectrum. Recommendations describe future research, development and demonstration efforts necessary to assess and reduce the adverse impact of highway deicing. (Author)

Identifiers: *Waste gas recovery, *Air pollution control.

A summary is provided of the screening studies undertaken to evaluate the following potential agents for removing SO2p impregnated silica gels, impregnated fly ash, hydroxides, sulfides, and sodium carbonates. The report discusses the construction and operation of a sorbent screening unit which is capable of evaluating the sorption characteristics of a given material in less than one hour. The most active sorbents found in these studies were sodium carbonate and sodium bicarbonate. The sodium carbonates were the only materials found in this study which sorbed large amounts of SO2 at 125C, the flue gas exit temperature. A preliminary economic evaluation of the sodium carbonate sorption systems revealed that a regenerable system for an 800 mw plant would cost about $4/ton of coal for removal of 90% of the SO2.

For roughly eight weeks (February 10 to March 31, 1970), wells on the Chevron Oil Company platform Charlie in the Main Pass Oil Field (MP41C), Gulf of Mexico, were out of control, spewing crude oil and natural gas into the air from the platform level. The report documents the observed and potential pollution effects, and pollution control efforts connected with the above casualty for the purpose of preparing a timely report. The objective was to put a small multi-discipline team of scientists and engineers in the field to make observations and conduct interviews with participants in the casualty, while the events were still freshly in mind. For the most part, the information presented herein is culled from interviews with Federal, State and local agencies involved in the casualty or with the resources of the area. Off-the-record interviews were held with a representative of the Chevron Oil Company. Information was culled from numerous technical publications, newspapers and from public records. (Author)

Identifiers: *Oil pollution, *Oil pollution removal, Oil slicks.

Efforts are being directed to develop effective countermeasures against floating oil slicks. Mechanical recovery methods, which do not cause additional environmental insult, are most attractive. Such a concept, a hydraulic skimmer, was investigated. Floating headers, providing a linear water spray pattern on the water surface, are attached to an open sea workboat. Sea water is pumped through spray nozzles mounted on the headers to move an oil slick toward the boat. Side mounted chambers are positioned to collect the concentrated floating oil. Recovered fluid is pumped to an onboard separation system from which the oil is transferred to floating tanks or barges and the water is recycled to the spray system. Experimental work was directed toward component development and evaluation of a large system model in a simulated environment. Model experiment results showed, for light oils, 80 to 100 percent effectiveness and oil recovery rates of 6600 to 8700 gph. Results with Bunker fuel were not as good, being on the order of 1300 to 1800 gph and 12 to 30 percent effective in recovering oil from the water surface. (Author)

Identifiers: Cement industry, Air pollution effects (Humans), Air pollution detection.

A program was conducted to quantify fine-particle emissions (0.01-2 microns) from particulate pollution sources. The primary objective was to use the best data currently available (i.e., 1969-1970) on particle-size distributions of particulates from uncontrolled and controlled sources, fractional efficiency curves for specific control devices, and the degree of application of control equipment on specific sources to estimate the mass and number of fine particles emitted from particulate pollution sources. Secondary objectives were the assessment of (1) the applicability of standard sampling and particle sizing methods to the fine particle regime, and (2) the current understanding of the adverse effects of fine particulate pollutants. This report presents the results of this study.

A handbook is presented as part of the documentation for a study of particulate air pollution from stationary sources. The objective of the study was to identify, characterize, and quantify the particulate air pollution problem in the U.S. The document delineates the kind and number of stationary particulate sources, the chemical and physical characteristics of both the particulates and carrier gas emitted by specific sources, and the status of current control practices. The first three chapters of the handbook present general background information pertaining to source emission factors and emission rates effluent characteristics, and control technology. The next chapter discusses some of the more important chemical and physical properties of particulates and carrier gas emitted by industrial sources. The remaining chapters present discussions of the major industrial sources of particulate pollutants. (Author)

Contract EPA-68-02-0013

Descriptors: (*Sulfur dioxide, *Infrared spectra), (*Flue gases, Air pollution), Emission spectra, Absorption spectra, Tables (Data), Water vapor, Carbon dioxide, Temperature, Errors.
Identifiers: *Air pollution detection, Spectroscopic analysis.

The absorption by the V (1) (1151.38/cm) and V (3) (1361.76/cm) bands of SO2 has been studied between 1050 and 1400/cm (9.5-7.1 micrometers). Spectral curves of transmittance have been scanned with approximately 1/cm resolution for more than 200 samples varying in temperature from about 296 K to 575 K and in pressure from 0.01 to 16 atm. The objective was to provide data on SO2 absorption and emission that are required to interpret data obtained in this spectral interval on the emission by smokestack exhausts containing SO2. An extensive table provides information from which the emission between 1050 and 1250/cm can be calculated for temperatures between 296 k and 650 K. Water vapor absorbs and emits so strongly in the region of the V (3) band of SO2 that this band is probably not useful for remote sensing of smokestacks. Therefore, the V (1) band was emphasized. The strengths of the two prominent bands in molecules are: V (1), 371 plus or minus 20 x 10 to the -20th; and V (3), 3020 plus or minus 200 x 10 to the -20th. (Author)

Laboratory studies of a chemical denitrification process, namely copper catalyzed ferrous iron reduction of nitrate ion in basic media, demonstrated that denitrification of dilute (10 ppm NO3-N) nitrate solutions to a mixture of innocuous gaseous products was possible. 95 to 98% of the reduced nitrate was in the form of NH3, N2, N2O, NO2 and unreacted NO3. Optimum conditions for reaction were: initial pH near 8 (mole ratio of OH (-)/Fe (++)= 1.5); Mole ratio Fe (++)/NO3 (-) =8; Concentration of catalyst 1-5 ppm Cu (++) with the reaction being carried out under anaerobic conditions; Fe (++) ion derived from the sulfate; NaOH used for pH adjustment; and Phosphate removed and carbonate content decreased. Preliminary investigation of reduction in a continuous flow system was encouraging. The by-product magnetite, was easily separated from the treated water in the absence of appreciable phosphate which inhibits its formation. Data from 280 experiments were tabulated. Cursory studies in potable water and secondary effluent indicate the presence of as yet unidentified inhibitory substances.

Contract DI-14-12-562
Paper copy available from GPO $0.70 as SN-5501-0113.

Descriptors: (*Sewage treatment, Activated sludge process), (*Enzymes, *Activated sludge process), Separation, Lagoons (Ponds), Colloids, Gels, Bacteria, Aeration, Ribonucleic acids, Amylase, Lipase, Polyacrylamides.

Degradation and utilization of waste water nutrients by microbial action is controlled by a complex enzyme system. In attempts to produce a faster-acting system, a method was developed to biochemically fractionate the microbial enzymes from activated sludge, to concentrate and characterize their activity, and to immobilize this activity by entrapment in a polyacrylamide gel. The enzyme gel preparation was tested for its effect on the biological degradation of a bench-scale activated sludge process. Soluble enzymatic components were readily separated from particulate cell components, and the remaining soluble system was fractioned such that catabolic activity in the enzyme systems of interest was maintained while non-essential components were removed. Immobilization within the gel allowed activity to be maintained during repeated washings, exposure to substrate, and storage. Limited bench-scale tests produced no meaningful results possibly on account of either incomplete polymerization of the gel, an improper activated sludge culture, or both.

BIO-REGENERATED ACTIVATED CARBON TREATMENT OF TEXTILE DYE WASTE WATER.
Water pollution control research series,
Clarke A. Rodman, and Edward L. Shunney. Jan 71, 79p* W72-00003, EPA-WQO-12090-DWM-01/71
Prepared in cooperation with Masland (C. H.) and Sons, Carlisle, Pa.

Descriptors: (*Dyes, *Industrial waste treatment), (*Water pollution, Dyes), (*Activated carbon treatment, Dyes), Industrial wastes, Regeneration (Engineering), Adsorption, Biodeterioration, Cost estimates, Industrial engineering, Operating costs, Decoloring, Materials recovery, Field tests, Textile industry.
Identifiers: *Water pollution control, Chemical oxygen demand.

A continual adsorption-biological regeneration cycle of the activated carbon beds treating a dyehouse effluent has been achieved over a four-month period, resulting in a continuous decolorization and organic reduction. The textile dye wastes can be easily decolorized by a single pass flow through fixed granular activated carbon beds at an average flux of 12 gpm/sq ft, provided that the color bodies are receptive to carbon adsorption. The exhausted carbon can then be regenerated biologically provided that the adsorbate is biodegradable. Biological regeneration provided an adsorption capacity in excess of 1.6 lbs COD per lb of carbon, in this instance. Color removal was virtually complete at the two flow rates evaluated. A 1.0 mgd plant was designed. For 50% COD removal estimates were $230,000 for construction and 8.3 cents/1000 gallons for operation. For 75% COD removal, the estimates were $550,000 and 23.1 cents/1000 gallons respectively.

RUBBER REUSE AND SOLID WASTE MANAGEMENT. PART I. SOLID WASTE MANAGEMENT IN THE FABRICATED RUBBER PRODUCTS INDUSTRY, 1968. PART II. WASTE RUBBER AND ITS REUSE, 1968,
Robert J. Pettigrew, and Frank H. Rominger. 1971, 128p EPA-SW-22c-71
Contract PH-86-68-208
Paper copy available from GPO $1.25 as stock no. 5502.0028.

Descriptors: (*Elastomers, Waste disposal), (*Rubber industry, *Waste disposal), (*Materials recovery, Elastomers), Tires, Tire tubes, Regeneration (Engineering), Economic analysis, Cost estimates, Earthfills, Bibliographies, Consumption rate.
Identifiers: *Solid waste disposal, *Waste recycling.

The study defines the solid waste management problem of the fabricated rubber products manufacturing industry for the production year 1968 and examines the reuse potential of the industry's waste, as well as the reuse potential of worn out rubber waste from the consumer, mostly tires and inner tubes. In the manufacture of 10.7 billion pounds of salable rubber products in 1968, it is estimated that 1,058 million pounds of solid wastes had to be disposed of at the fabricating locations and at a disposal cost of about $9.5 million. In most cases, contractors haul solid waste from the plant site for disposal elsewhere, generally to a landfill. For the entire industry, the weighted average cost for both in-plant collection and offsite disposal approximates $18 per ton of solid waste. In the rubber industry, retreaders, reclaimers, and tire splitters are reusing and recycling solid waste; however, the trend is downward for recycle or reuse. Other possibilities for reusing rubber product waste are discussed.

Identifiers: *Solid waste disposal, *Waste recycling, *Food supplements, High protein supplements.

The design, construction, and operation of a pilot-plant unit to convert waste sugarcane bagasse into microbial single-cell protein by a previously developed process is described. After the bagasse was ground and given a milk alkaline oxidation treatment it was fermented on a continuous-flow basis by Cellulomonas, sp bacteria, and also by a mixed culture run of Cellulomonas and the symbiotic organism Alealigenea faecalis. Maximum cell density obtained with pure Cellulomonas was 1.7 g dry weight per liter and 6.24 g per liter for the mixed culture. Culture mass-doubling times during log-phase growth were usually from 3.2 to 3.7 hr. The maximum experimental volumetric production efficiency of a continuous run using pure Cellulomonas was about 0.10 g of dry cell mass per liter of fermenter capacity per hr. The single-cell protein, produced as a light brown to yellow-brown powder, has a crude protein content of 50 to 55 percent. (Author)

THE ROLE OF NONPACKAGING PAPER IN SOLID WASTE MANAGEMENT, 1966 TO 1976. PART I: INTRODUCTION, PART II: THE OUTLOOK FOR NONPACKAGING PAPER, 1966 TO 1976, PART III: THE IMPACT OF NONPACKAGING PAPER ON SOLID WASTE,
William E. Franklin, and Arsen Darnay. 1971, 71p EPA-SW-26c-71
Contract PH-86-67-114
Paper copy available from GPO $0.75 as EP3.2:P19.

Descriptors: (*Paper products, *Waste disposal), (*Waste papers, *Refuse disposal), (*Papers, Consumption rate), Forecasting, Materials recovery, Newsprint, Printing papers, Container board, Sanitary engineering.
Identifiers: *Solid waste disposal, *Waste recycling.

The proportions of nonpackaging paper tonnage that entered the solid waste stream in 1966 and that would do so in 1976 were established. Nonpackaging paper includes such items as newsprint, printing papers, stationery, towels, and household tissues, construction paper and board, and nonwoven disposables. Qualitative and quantitative information about nonpackaging paper was acquired and evaluated to arrive at forecasts of consumption in 1976. Disposal characteristics and rates are discussed. Calculations indicated that 14.3 million tons reached disposal sites in 1966 and this amount is expected to increase by 6.3 million tons by 1976. In pounds per capita, discarded paper will increase from 200 lb in 1966 to 250 lb in 1976, a net change of 25 percent.

SOLID WASTE MANAGEMENT IN RECREATIONAL FOREST AREAS,
Charles S. Spooner. 1971, 104p EPA-SW-16ts-71
Paper copy available from GPO $1.00 as EP3.2:R24.

Descriptors: (*Recreational facilities, *Waste disposal), (*National parks, Waste disposal), Forest land, Cost estimates, Refuse disposal, Food, Collection, Rates (Per time), Earthfills.
Identifiers: *Solid waste disposal, *Sanitary landfills, National forests.

A study was conducted at selected Forest Service districts to establish waste generation rates for major recreational activities and to determine the cost of solid waste handling. Study teams collected solid waste from recreational areas during the study periods and weighed and sorted it into three categories: food wastes, other combustibles, and noncombustibles. Waste quantities produced by each recreational activity were correlated to the use the area had received during a 1-day period of waste accumulation. The standard measure of recreational use was the 'visitor day,' defined as 12-hr use of a recreational facility by one person or use by many persons whose aggregate time in an activity equals 12 hr. Some of the results of the study were that generation rates did not vary regionally or with the level of campground development; that containers were well-designed and maintained; that land-disposal sites were de facto dumps, not operated to local, State, or Federal standards; and that the distance from the Forest Service recreational area to the disposal site and the intensity of recreational use in the area had the most influence on the cost of solid waste collection. SANITARY LANDFILL, DESIGN, CONSTRUCTION, AND EVALUATION,
Maxwell J. Wilcomb, and H. Lanier Hickman, Jr. 1971, 15p EPA-SW-88ts-71
Paper copy available from GPO $0.30 as stock no. 5502-0031.

Descriptors: (*Refuse disposal, *Earth fills), (*Sanitary engineering, Earth fills), Recommendations, Site surveys, Operations, Performance evaluation, Design criteria, Urban planning.
Identifiers: *Solid waste disposal, *Sanitary landfills.

The report provides information to help designers, operators, and control agencies achieve and maintain good sanitary landfill practices. Recommendations suggest basic requirements involved in designing and constructing a sanitary landfill. An evaluation method has been developed to measure the level of acceptability of the operations taking place at a disposal site and to provide a comparison of its suitability with that of other evaluated sites. The evaluation provides a tool that a community, organization, consultant, or citizen can use to judge the design and construction of any site under consideration. (Author)

COMPUTER SIMULATION OF THE HYDROLOGIC-SALINITY FLOW SYSTEM WITHIN THE UPPER COLORADO RIVER BASIN,
M. Leon Hyatt, J. Paul Riley, M. Lynn McKee, and Eugene K. Israelsen. Jul 70, 263p PRWG-54-1 W72-00084, EPA-WQO-16090-DVU-07/70

Descriptors: (*Rivers, Salinity), (*River basins, Computerized simulation), Water resources, Mathematical models, Analog simulation, Water pollution, Irrigation, Management planning, Computer programs, Wyoming, Utah, Colorado, New Mexico.
Identifiers: Colorado River, San Juan River.

Changes in the hydrologic equilibrium of a river basin resulting from resource development also produce changes in the quality pattern. Since the burden of quality maintenance must be shared by users (just as are quantities) predictions are needed for quality changes which might result from contemplated development at any specified location within the river system. This study reports the development of a computer simulation model of the water and salt flow systems within the Upper Colorado River basin. Because of the close relationship between the hydrologic and salinity flow systems, an understanding of the hydrologic system is essential to successful management of the salinity system. In this study development of a hydrologic model is based on water budgeting or accounting procedures, in which available data on historical water flows, municipal and industrial uses, and the demands of agriculture are used. The salinity dimension is then added, and the joint hydro-salinity model is verified (calibrated and tested) by comparing computed and observed output values. The utility of the model is demonstrated by applying it to a particular subbasin of the San Juan River and predicting the effects on downstream water quantity and quality of developing a large irrigation project within the area. Identifiers: Water pollution control, *Storm water runoff, Saint Paul (Minnesota), Minneapolis (Minnesota).

Results of initial operation of a computer-based data acquisition and control system for a major urban combined sewer system are presented. Impressive reductions in combined sewer overflow pollution of the Mississippi River in Minneapolis

and St. Paul have been effected. Working entirely within the limits of the existing interceptor sewer system, and with relatively minor modifications to selected major combined sewer regulators, incidence of overflow was reduced by 66% and duration of overflow by 88% during most of a rainfall season. Computer simulation techniques using actual rainfall data indicate that the amount of overflow volume reduction achieved is the equivalent of a $200 million separation project. A mathematical model has been developed that will, with rain gage data as input, perform runoff analysis, diversion of combined sewer runoff hydrographs at regulators, and routing of diverted hydrographs through the interceptor system. Descriptors: (*Mine waters, *Water pollution), (*Coal mines, Water pollution), (*Pyrites, *Oxidation), Controlled atmospheres, Air, Nitrogen, Methane, Carbon dioxide, Surface drainage.
Identifiers: *Mine acid drainage, *Water pollution control.

Experiments up to 150 days in length were conducted to study the acid production rate of coal mine pyrites under various gas atmospheres. The gas atmospheres studied were air, nitrogen, methane, and carbon dioxide. The lower limits of the oxidation process were studied by introducing small amounts of oxygen along with the inert blanketing gas and by studying the effects of deaerated versus air saturated feedwater. Acid production was proportional to the available oxygen partial pressure. The acid parameters monitored continued to change and had not completely reached a steady state by the termination of the work. The acid production of nitrogen blanketed pyrite decreased to less than 1% of that of identical columns under air atmosphere. Nitrogen and methane gases were equally effective in reducing acid production. Both of these gases were slightly more effective than carbon dioxide. A large amount of detailed experimental data is presented. (Author)

Descriptors: (*District of Columbia, *Storm sewers), (*Sanitary engineering, Combined sewers), (*Combined sewers, District of Columbia), Outfall sewers, Sewage filtration, Design criteria, Surface water runoff, Sewage treatment, Capital costs, Operating costs, Water pollution, Hydrology, Underground storage, Cost estimates, Suspended sediments, Water quality, Monitors, Tunneling (Excavation).
Identifiers: *Storm water runoff, Potomac River, Water pollution control.

Objectives of the project were: Define the characteristics of combined sewer overflow; Investigate the feasibility of high-rate filtration for treatment of combined sewer overflow; and Develop and evaluate alternative methods of solution. Investigative activities included: Review of pertinent reports and technical literature; Field monitoring of combined sewer overflows and separated storm water discharges at three sites; Laboratory studies of ultra-high-rate filtration of combined sewer overflow; Hydrological analysis; and Evaluation of feasible alternatives (based on conceptual design, preliminary cost estimates, and other factors). Reservoir Storage, Treatment at Overflow Points, Conveyance Tunnels and Mined Storage, and Sewer Separation were the approaches considered sufficiently promising for detailed evaluation. Tunnels and Mined Storage with treatment at the Blue Plains plant and at Kingman Lake after subsidence of the storm is recommended. Estimated capital costs (based on the 15-year storm) are $318,000,000 with annual operation and maintenance costs of $3,500,000. This approach also was preferable to the others on the basis of systematic evaluation of reliability, flexibility, public convenience and other non-quantifiable factors. (Author)

Paper copy available from GPO $0.65 as stock no. 5501-0125.

Descriptors: (*Ground water, Infiltration), (*Feeders, Wastes), (*Cattle, Feeders), Inorganic nitrates, Feeding stuffs, Water pollution, Permeability, Soils, Texas.
Identifiers: *Cattle feedlots.

Detailed field and laboratory studies of five feedlots were conducted to determine field seepage rates and distributive geometry of infiltrated runoff. Practical field seepage rates at these sites ranged from 2 to 20 feet/year. Dispersal rates of ions in the groundwater zone varied from 45 to 400 feet/year. Nitrogen (NO3, NO2, NH4, Org-N) and common chemical parameters (Ca, Mg, Na, K, Cl, SO4, TDS, pH, and conductance) were determined in cores and groundwater samples; based on groundwater analyses from 80 Texas High Plains feedlots, rates of concentration of NO3-N and Cl in groundwater beneath feedlots range from 0.07 to 0.4 p.p.m. per year, and average 0.17 p.p.m. per year. EVALUATION OF DISPERSED POLLUTIONAL LOADS FROM URBAN AREAS,
Jerry G. Cleveland, George W. Reid, and Jim F. Harp. Apr 70, 224p W72-00355, EPA-WQO-16090-DBX-04/70

Descriptors: (*Surface water runoff, *Water pollution), (*Urban areas, Surface water runoff), Storm sewers, Mathematical models, Dispersing, Watersheds, Nutrients, Bacteria, Seasonal variations, Sedimentation, Sewage, Oklahoma, Field tests, Correlation techniques, Forecasting, Concentration (Composition).
Identifiers: *Tulsa (Oklahoma), *Storm water runoff.

The objective was to develop a technique of evaluating the dispersed pollutional loads from urban runoff. The technique involved analytically determining several pollutant parameters from twelve separate drainage basins, and then correlating the pollution levels to land use practices. The study used the statistical tools of correlation coefficients, component analysis, and multiple regression analysis to develop predictor models for estimating urban dispersed pollutional concentrations and loads. Separate mathematical equations for estimating the expected seasonal bacterial, organic, nutrient, and solid concentrations from urban runoff were developed. The predictors used in the equations were common urban area variables, such as population, population density, commercial establishment density, percentage of streets, and environmental index. Twelve mixed land use drainage basins located in the City of Tulsa, Oklahoma, were used as the test areas. (Author)

Identifiers: *Water pollution control, Thermal pollution.

The growth of population and insutry in the coastal regions of the country, along with increased use of coastal waters for disposal of wastes produced inland, presents the potential of new or increased pollution in a valuable national resource. In order to assure that marine water auality is maintained and enhanced for present and future water uses, each source of waste input must be evaluated for its impact on the environment. Treated wastes must be discharged in such a manner and location that the resulting concentrations and contact times do not violate the water quality requirements specified for the desired water uses. The disposal process can be designed within these constraints through a mix of at least four techniques: degree and type of waste treatment; site selection; outfall or barge distribution of wastes; barrier construction. The report presents a review of the literature pertinent to the theoretical development of present ocean outfall design technology as it applies to waste discharges in general.

DYNAMICS OF THE NITROGEN CYCLE IN LAKES.
Final rept.,
Vera Alexander. Mar 70, 220p R71-7 W72-00354, EPA-WQO-16010-DDS-03/70

Descriptors: (*Nitrogen cycle, *Water chemistry), (*Nitrogen fixation, *Fresh water biology), (*Alaska, *Limnology), Lakes, Algae, Nitrogen isotopes, Nitrates, Ammonia, Denitration, Metabolism, Sampling, Labeled substances, Seasonal variations, Nutrients, Water pollution.
Identifiers: Nitrogen 15, *Subarctic regions, *Eutrification.

The importance of nitrogen fixation by blue-green algal populations was established, and nitrogen-15 was introduced for measuring in situ nitrogen fixation rates in natural waters. Nitrogen-15 techniques were developed for measuring nitrate and ammonia uptake, and the importanc3 of ammonia as a nitrogen source in lakes became apparent. Denitrification rates were measured accurately in anoxic lake waters. Rapid ammonia supply and turnover was demonstrated in lake waters. This implies that substantial nitrogen regeneration takes place constantly in surface waters of these lakes, and that this can provide a major nutrient source for the photosynthetic population. Such ammonia supply is independent of any sediment interaction. The limnological information available for interior Alaska has been expanded through the work. The Dumas method using a Coleman nitrogen analyzer were introduced for

preparing nitrogen samples for mass spectrometry. (Author)

Descriptors: (*Air pollution, *Exhaust gases), (*Photochemical reactions, *Smog), (*Automobile engines, Starting), Atmospheric diffusion, Hydrocarbons, Sources, Carbon monoxide, Ozone, Nitrogen dioxide, Diurnal variations, Atmospheric composition, California, Computerized simulation.
Identifiers: Los Angeles (California).

The influence of cold-start vehicle emissions on air quality is investigated using a photochemical/diffusion model. Both the time and space distribution of cold starts are examined. A day from an October 1968 Los Angeles smog episode serves as a baseline for determining diffusion coefficients, nitrogen balance, and hydrocarbon reactivities. Vehicular and stationary sources for 1968, 1971, 1974, and 1980 are emission inputs, and pollutant concentrations at the ground are air quality outputs. Stagnant central basin conditions govern the time phasing studies. Emissions introduced during the starting process have the greatest effect of all on carbon monoxide peaks, the effect being to increase the peak CO concentration from 9 to 13 percent. The levels of ozone and nitrogen dioxide that build up later in the day are influenced less because chemical processes afford dilution time. If vehicle starts are decentralized geographically, only a slight increase in the pollutant loading is noted because of the low morning speeds. Based on the results of the study, three possible weighting schemes are proposed for combining cold-start and hot start driving cycles. (Author)

Identifiers: *Automobile exhaust, *Air pollution control, Air pollution standards.

A report is presented which is directed to the definition and analyses of governmental approaches to control air pollution from privately owned automobiles. The report is separated into three basic components: Average emission per vehicle per mile; Miles of use; and Location of use. Chapter 1 discusses policies aimed at the automotive industries to encourage development of pollution control technology and low pollution fuels. Correspondingly, the range of policies available to induce the motorist to do his part to control average emissions per mile are discussed in Chapter 2. Chapter 3 considers the measures available to reduce the aggregate amount of annual automobile use. Chapter 4 details what urban planners can do to reduce auto pollution emissions in urban areas and facilitate dispersion of existing pollution. The two remaining chapters deal with the relations among these focal points.

Identifiers: *Air pollution control, *Coal (High sulfur), *Waste gas recovery, Cat-Ox process, Claus process.

The pyritic sulfur content of some bituminous coals can be reduced by gravimetric separation or 'washing'. The extraction of energy and sulfur value contained in the reject fractions is technically feasible. Under favorable conditions the sale of extracted energy and sulfur products will to some degree offset the cost of washing. The purpose of the study was to select, design, and evaluate the high sulfur combustor and sulfur recovery process with the greatest potential for utilizing high-ash, high-sulfur coal reject material produced by the deep cleaning of coal. The report therefore includes preliminary designs and evaluations of several combustion and flue gas treating systems for processing high sulfur fuels drawn off from rejects of coal washing. These fuels, will need to be made up to specifications that depend on; the requirements of available processes for sulfur value recovery, and on the limitations of combustion equipment in respect of ash. The 'High Sulfur Content' (HSC) Fuel specifications can be satisfied by appropriately re-combining selected portions of reject material from deep cleaning of coal. Four specimen HSC Fuel compositions are tabulated along with product and cost data on six processing systems for these fuels. (Author)

THE HIGH SULFUR COMBUSTOR. A STUDY OF SYSTEMS FOR COAL REFUSE PROCESSING. VOLUME II. DESCRIPTIVE DETAIL.
Final rept.

Feb 71, 530p* APTD-0769
Contract CPA-22-69-151
See also Volume 1, PB-203 958.

Descriptors: (*Furnaces, Design criteria), (*Coal, Specifications), (*Air pollution control equipment, *Sulfur dioxide), Ash content, Combustion, Particle size, Physical properties, Abrasion, Corrosion, Cost estimates, Steam electric power generation, Boilers, Engineering drawings, Combustion products, Air pollution, Materials recovery.
Identifiers: *Coal (High sulfur), *Waste gas recovery, *Air pollution control, Cat-Ox process, Claus process.

The purpose of the report is to evaluate certain combustion systems which are designed to make use of high ash, high sulfur reject materials from coal cleaning by means that will generate steam and permit the recovery of sulfur value. Specific compositions of the rejects were not pre-defined. Specifications of the fuels derived from the rejects ('HSC Fuels') have been developed to accommodate the economics or technical limitations imposed by the processes selected. The scope of the analysis includes both general and specific design considerations in the following order: The HSC Fuel characteristics as determined by variables in composition; Suitability of currently available combustion systems to the proposed boiler design; Specification of the HSC Fuel characteristics required by each combustion system and selection of the combustion system best suited to the process; Preparation of conceptual boiler designs and cost estimates for a 500,000 lb/hr. industrial boiler, a 500 MW (megawatt) utility boiler, and a prototype boiler design at 50 MW capacity. Tests and procedures fo verifying the HSC Fuel characteristics are recommended. The commercial-scale and prototype designs are developed and cost-estimated according to normal proposal standards. FEASIBILITY OF COMPUTER CONTROL OF WASTEWATER TREATMENT.
Water pollution control research series.

Dec 70, 83p W72-00408, EPA-WQO-17090-DOY-12/70
Contract FWQA-14-12-580
Paper copy available from GPO $1.00 as stock no. 5501-0145.

Descriptors: (*Sewage treatment, *Automatic control), Computers, Monitors, Automatic control equipment, Sanitary engineering, Cost estimates, Data aquisition, Feasibility.
Identifiers: Computer aided control systems.

A wastewater treatment study was conducted to: Analyze the advantages and limitations associated with the use of computers in the management and control of wastewater treatment facilities; Document potential applications and utilization procedures; and Recommend further research to achieve full computer implementation of wastewater treatment operations and associated management functions. Current problems and procedures were surveyed, including site visits to plants already automated to some extent. In addition, manufacturers were queried as to the availability of the monitoring and controlling equipment needed. Results indicated that management is indeed interested in automatic controls and computer application, but that both will come about largely on a piecemeal basis. Computer hardware and communication equipment is available and is already being utilized in many instances, but many on-line sensing instruments are not available.

REDUCTION OF SALT CONTENT OF FOOD PROCESSING LIQUID WASTE EFFLUENT,
Walter A. Mercer, and Jack W. Ralls. Jan 71, 51p
EPA-WQO-12060-DXL-01/71, W72-00409
Paper copy available from GPO $0.55 as stock no. 5501-0136, EP2.10:12060DXL.

Descriptors: (*Food processing, Industrial waste treatment), (*Water pollution, *Brines), (*Ion exchanging, Industrial waste treatment), (*Water reclamation, *Industrial waste treatment), Sodium chloride, Pilot plants, Performance evaluation, Cost estimates, Ion exchange resins, Regeneration (Engineering).
Identifiers: *Olive processing, *Water pollution control.

Oliver processing brines containing 0.05 to 0.7% sodium chloride were passed through a mixed bed of cation and anion exchange resins in a process known as the Aqua-Ion process. Influent pH, salt content, and COD levels were the particular variables of interest investigated. Sodium chloride levels of 500 to 7000 ppm were subjected to random variations in pH and COD levels, with 94% removal being obtained at 2700 ppm, the optimum for the ranges investigated. Holding pH and COD constant, sodium chloride levels were varied between 600 and 6000 ppm, with resulting effluent concentrations of 150 ppm for influent concentrations of 600, 1000, and 2700 ppm. Influent concentration of 6000 ppm resulted in an effluent concentration of 790 ppm. Calcium hydroxide regeneration was used, with the regenerant being repeatedly cycled through the resin bed to establish the maximum salt concentration attainable in the regenerant effluent. Levels of 3000 ppm were obtained with no indication of leveling off. Pretreatment with activated carbon reduced distributor deposit formation, ennabling possible flow rates of 10,000 gpd. Cost analyses based on pilot plant information predicted a cost of 26 cents per 1000 gallons treated.

EMISSIONS FROM A GASOLINE- AND DIESEL-POWERED MERCEDES 220 PASSENGER CAR.
Rept. for Apr-Jul 71,
Karl J. Springer. Jun 71, 62p SwRI-AR-813
EPA-CPA-70-44-B
Contract CPA-70-44

Descriptors: (*Air pollution, *Automobile engines), (*Spark ignition engines, Exhaust gases), (*Diesel engines, *Exhaust gases), Hydrocarbons, Carbon monoxide, Nitrogen oxides, Aldehydes, Odors, Particles, Gasoline, Diesel fuels, Comparison, Gas analysis.
Identifiers: *Automobile exhaust, Mercedes Benz 220D.

The project investigated emissions from a typical car with a diesel engine, the Mercedes Benz 220D, and a comparative car with a gasoline engine, the Mercedes Benz 220. Both hydrocarbon and carbon monoxide emissions were over 90% lower in the diesel vehicle. Nitrogen oxides emissions were 50% lower in the diesel vehicle. Other emissions including aldehydes were also measured. The 1972 Federal Test Procedure (CVS) was used for these tests. (Author)

MEASUREMENT OF ELECTROMAGNETIC RADIATION LEVELS FROM SELECTED TRANSMITTERS OPERATING BETWEEN 54 AND 220 MHZ IN THE LAS VEGAS, NEVADA, AREA,
Kenneth R. Envall, Richard W. Peterson, and Sep 71, 65p BRH/DEP-72-4 FDA72-8012
Paper copy available from GPO $0.75 as HE20.4110:72-4.

Descriptors: (*Radio field strength, Measurement), (*Radiation hazards, Radio waves), (*Public health, *Radio waves), Very high frequency, Electromagnetic radiation control, Radio transmitters, Television transmitters, Radiofrequency power, Nevada, Computer programs.
Identifiers: *Radio frequency radiation hazards, *Electromagnetic radiation hazards, Las Vegas (Nevada).

Electromagnetic power levels were measured and compared with theoretical power levels from selected transmitters operating in the frequency range of 54 to 220 MHz in the Las Vegas, Nevada, area. The field measurements were made at 62 grid locations by means of calibrated dipole and biconical antennas. Power variations with respect to antenna height, time of day, distance from a grid point, angular dependence, and terrain were investigated. The data were evaluated in terms of observed and theoretical power levels and converted to power densities for hazards analysis applications. The results indicate that estimates of theoretical power levels should serve as a satisfactory measure of population exposure to electromagnetic energy in the frequency range considered. (Author)

CATALYTIC CONTROL OF NO (X) EMISSIONS FROM MOBILE SOURCES.
Final rept. 1 Jul 70-31 Jul 71,
Manfred I. Seegall, James C. Napier, and William A. Compton. Dec 71, 142p* RDR-1700 EPA-EHS-70-114
Contract EPA-EHSH-70-114

Descriptors: (*Air pollution, Exhaust gases), (*Exhaust gases, Nitrogen oxides), (*Air pollution control equipment, *Motor vehicles), (*Nitrogen oxides, Air pollution control equipment), (*Automobiles, Air pollution control equipment), (*Catalysts, Nitrogen oxides), Catalysis, Rare earth compounds, Platinum, Palladium, Copper inorganic compounds, Monel, Ammonia, Oxides, Performance evaluation, Gas chromatography, Carbon monoxide.
Identifiers: *Catalytic reactors (Exhaust systems), Copper dichromates, *Air pollution control, Automobile exhaust.

The project investigated the use of various catalytic media to control nitrogen oxide emissions from motor vehicles. Laboratory tests of various compounds were conducted. The compounds tested included rare earth oxides, platinum, palladium, copper dichromate, and modified monels. The modified Monel compounds were found most effective in reducing nitrogen oxides. The ammonia formulation of all these catalysts was also measured and was frequently found significant. (Author)

PUBLIC RESPONSE TO DIESEL ENGINE EXHAUST ODORS.
Final rept. Feb 70-Apr 71,
Charles T. Hare, and Karl J. Springer. Apr 71, 89p
SwRI-AR-804 EPA-CPA-70-44-A
Contract CPA-70-44

Descriptors: (*Public opinion, *Odors), (*Air pollution, Odors), (*Exhaust gases, Odors), Diesel engines, Texas, Buses (Vehicles), Questionnaires, Demography, Surveys.
Identifiers: *Diesel engine exhaust, San Antonio (Texas).

The project investigated public response to various levels of diesel exhaust odor. A mobile laboratory called the Sniffmobile was set up in various areas including shopping centers in the San Antonio area. Volunteers were presented with calibrated samples of diesel exhaust odor. Over 90% of the participants found levels of this odor as experienced from a city bus objectionable. (Author)

A STUDY OF MARKETS FOR AIR POLLUTION MEASUREMENT INSTRUMENTATION 1971--1980,
Rene R. Bertrand. Jun 71, 97p* APTD-0800
Contract CPA-22-69-154

Descriptors: (*Gas detectors, *Marketing), (*Air pollution, *Market research), Forecasting, Instruments, Monitors, Gas sampling, Exhaust gases, Economic analysis, Samplers, Sources, Industries.

Identifiers: *Air pollution detection, Automobile exhaust.

The market for air pollution instrumentation during the decade of the 70's has been determined. The market analysis presented is based on the survey of instrumentation requirements conducted at the federal, state, and local level and on an analysis of current legislation and air pollution control codes. The market was estimated for three areas of measurement instrumentation: ambient level monitoring, stationary source emission measurement, and auto exhaust measurement. This market amounts to nearly one-half billion dollars during the coming decade, some 76% of which represents initial purchases of air pollution measuring equipment. Industry will be the major purchaser of instrumentation accounting for 45% of the market. The market is heavily oriented towards stationary source emission measurement, this area accounting for one-half of the total instrumentation market value. It is shown that the timing is a critical factor in the market with each of the three areas of measurement reaching maturity at different periods during the decade. (Author)

A SURVEY AND ECONOMIC ASSESSMENT OF THE EFFECTS OF AIR POLLUTANTS ON ELECTRICAL COMPONENTS. VOLUME I - SECTIONS 1 THROUGH 9.
Final rept.

Aug 71, 91p* ETM-179 APTD-0797
Contract CPA-70-72

Descriptors: (*Electric devices, Corrosion), (*Air pollution, Electric devices), Sulfur dioxide, Economic analysis, Failure, Damage, Assessments.

An assessment was made of the economic impact of air pollution on electronic components. To begin the study, electronic components were divided into eleven different categories as defined by the Department of Commerce. The manner and amount of damage from air pollutants that might have been expected in each of these component categories was assessed by surveying the literature describing pollutant material damage mechanisms. The expected effects were compared with the actual experience of major manufacturing companies which appeared to account for most of the sales in each category. Where the literature survey indicated that gaseous sulfur compounds, notably sulfur dioxide, should be expected to account for most of the damage to electronic components, interviews with manufacturers revealed that particulate matter, actually was responsible for most of the electronic component and equipment malfunctions currently being experienced. The economic effects, which were represented by three cost categories, were applied to each component category and then summed to arrive at a total cost of about 15.5 million. (Author)

THE EFFECT OF INORGANIC SEDIMENT ON STREAM BIOTA.
Water pollution control series,
James R. Gammon. Dec 70, 150p W72-00851, EPA-18050-DWC-12/70
Paper copy available from GPO $1.25 as SN-5501-0074.

Descriptors: (*Water pollution, *Suspended sediments), (*Fresh water biology, Water pollution), (*Quarrying, Water pollution), (*Fishes, Suspended sediments), Limestone, Mining, Fishes, Turbidity, Growth, Industrial wastes.
Identifiers: *Water pollution effects (Animals), Spawning.

Quantitative effects of stonedust sediment from a crushed limestone quarry on fish and macroinvertebrate populations of an Indiana stream were studied for four years. Light inputs increasing suspended solids loads less than 40 mg/l, resulted in a 25% reduction in macroinvertebrate density. Heavy inputs caused increases of more than 120 mg/l including some deposition of sediment resulted in a 60% reduction in macroinvertebrate population density. Since most taxa responded to the same degree, population diversity indices were unaffected by density changes. Experimental introductions of sediment caused immediate increases in rate of invertebrate drift proportional to the concentration of additional suspended solids. Standing crop of fish decreased drastically when heavy sediment input occurred in the spring but fish remained in pools during the summer when input was heavy and vacated pools only after sediment deposits accumulated. After winter floods removed sediment deposits, fish returned to pools during spring months achieving 50% normal levels by early June. Only spotted bass was resistant to sediment; however, its growth rate was lower below the quarry than above. Most fish were much reduced in standing crop below the quarry.

A STUDY OF THE EFFECTS OF AEROSOL PROPERTIES ON SCATTERING OF LASER LIGHT.
Final rept.,
R. Lee Byers, Douglas W. Cooper, and John W. Davis. 1 Jul 71, 139p APTD-0796
Contract CPA-70-103

Descriptors: (*Aerosols, *Light scattering), (*Optical radar, *Air pollution), (*Particles, *Gas detectors), Backscattering, Humidity, Laser beams, Particles, Depolarization (Waves), Field tests, Alkali metal compounds, Dyes, Particle size.
Identifiers: *Air pollution detection, Alkali halides.

The influence of several variables on the backscattering of laser light by aerosols was studied. He-Ne laser light was used to illuminate aerosol particles generated by a Collison atomizer. The backscattering of light by the particles (effective angle: 173.5) was measured as a function of relative himidity. Depolarization and field studies were also made. Potassium chloride, sodium chloride, and sodium bromide particles all scattered more than twice as much light after becoming droplets. The change in phase occurred at lower humidities than those appropriate for the bulk material. These salt particles depolarized 13 to 25% of the incident polarized light intensity when dry particles and 6 to 12% of the incident light when droplets. The effect of changing ambient relative humidity was also studied for methylene blue dye and uranine dye particles. Depolarization measurements were also made for polystyrene latex and dioctyl phthalate aerosols. These gave depolarizations of 6% and 4% respectively. The laboratory device which measured the backscattering from the aerosols was used in a field test along with a LIDAR device. The field test, while not conclusive, indicated that relative humidity did affect LIDAR measurements. (Author)

AICE SURVEY OF USSR AIR POLLUTION LITERATURE. VOLUME X. THE TOXIC COMPONENTS OF AUTOMOBILE EXHAUST GASES: THEIR COMPOSITION UNDER DIFFERENT OPERATING CONDITIONS, AND METHODS OF REDUCING THEIR EMISSION,
M. Y. Nuttonson. 1971, 139p* APTD-0767
See also Volume 9 dated Jan 71, PB-203 504.

Descriptors: (*Air pollution, Exhaust gases), (*Automobile engines, *Exhaust gases), (*Air pollution control equipment, Exhaust gases), (*USSR, Air pollution), Spark ignition engines, Diesel engines, Toxicology, Carburetors, Afterburning, Fuel additives, Catalysts, Gas filters, Motor vehicle engines.
Identifiers: *Automobile exhaust, *Diesel engine exhaust, *Air pollution control, *Catalytic reactors (Exhaust systems), *Thermal reactors (Exhaust systems).

The report contains two articles dealing with investigations relating to the composition and to the methods of control of air pollutants emitted from the exhausts of motor vehicles. A report on neutralizing automobile exhaust gases presents the following information: Composition and toxicity of exhaust gases; Control of exhaust gases; Methods of reducing the formation of toxic components in exhaust gases; Neutralization of toxic components of exhaust gases; and Prospective automobile engines and extent of possible poisoning of the atmosphere by them. The second report discusses the determination of the composition of exhaust gases for carburetor engines under different operating conditions. (Author)

SANITARY LANDFILL FACTS,
Thomas J. Sorg, and H. Lanier Hickman, Jr. 1970, 41p EPA-SW-4ts-70
Library of Congress catalog card no. 70-607317.
Paper copy available from GPO $1.00 as HE20.1402:L23-2.

Descriptors: (*Refuse disposal, *Earthfills), Project planning, Public health, Design criteria, Economic analysis, Site surveys, Pest control, Operating costs, Capital costs, Construction equipment.
Identifiers: *Solid waste disposal, *Sanitary landfills.

General information is presented on the sanitary landfill as an effective solid waste disposal method. Emphasis is on areas of planning, design, operation, economics, equipment requirements, and public health. Criteria for selecting a site are developed, as well as general guidelines for the operation of a successful landfill. Public health aspects and nuisance control are stressed; their relation to initial landfill design and operation is shown. On-site facilities and equipment requirements are detailed. Initial investment and operation costs are broken down into outline form. A brief account of factors affecting a completed sanitary landfill includes comparative lists of advantages and disadvantages with this method of disposal. Illustrations are included.

DISMANTLING RAILROAD FREIGHT CARS: A STUDY OF IMPROVED METHODS WITH APPLICATION TO OTHER INDUSTRIAL PROBLEMS,
Dale M. Butler, and William M. Graham. 1969, 39p EPA-SW-3c-69 PHS-Pub-1850
Contract PH-86-67-100
Prepared in cooperation with Booz, Allen Applied Research Inc., Bethesda, Md. Library of Congress catalog card no. 75-603791.
Paper copy available from GPO $0.45 as FS 2.2:F88.

Descriptors: (*Freight cars, *Dismantling), (*Waste disposal, Freight cars), (*Materials recovery, Lumber), Decision making, Railroad cars, Metal scrap, Cost estimates, Combustion, Air pollution, Salvage, Incinerators, Economic analysis, Recommendations.
Identifiers: *Solid waste disposal, Open burning, Air pollution control.

Approximately 70,000 rail freight cars are dismantled each year for the purpose of salvaging reusable parts, scrap iron, and steel. About half of these cars each contain three to seven tons of wood, which must be removed before the scrap can be reused or recycled. To control or eliminate the pollution from open burning of railroad freight cars to remove the wood, alternatives were investigated and evaluated. A forced-decision model, which produces ordinally weighted scores, was devised to aid in selecting alternatives. Two high-scoring methods were a hooded self-incinerator and high-pressure water jets. Further investigation and phototype development on these two methods were recommended. (Author)

THE ROLE OF PACKAGING IN SOLID WASTE MANAGEMENT 1966 TO 1976,
Arsen Darney, and William E. Franklin. 1969, 217p* EPA-SW-5c-69
Contract PH-86-67-114
Library of Congress catalog card no. 76-601197.
Paper copy available from GPO $2.25 as FS2.2:SO4-8-966-76.

Descriptors: (*Waste disposal, *Packaging materials), (*Management planning, Packaging materials), (*Materials recovery, Packaging materials), Government policies, History, Forecasting, Demographic surveys, Economic analysis, Marketing, Environmental surveys, Taxes, Pollution, Consumption, Growth curves, Collection, Cost estimates, Metals, Glass, Plastics, Textiles, Wood products, Packaging papers, Cans.
Identifiers: *Solid waste disposal, *Waste recycling.

Packaging materials are increasing in quantity much more rapidly than the population, primarily because of the continuing rise in self-service merchandising. Per capita consumption, which was 404 lb in 1958, is expected to be 661 lb in 1976. Until recently, no systematic analysis of the relationship between packaging and solid waste disposal had been undertaken. These interactions are defined, and the differences, with possible solutions, are explored. In the report packaging materials, consumption data from 1959 to 1966 and the outlook from 1966 to 1976 are discussed. Also covered are the areas concerned with disposability, analysis of the collectability, the resistance to disposal and processing, and the salvageability and reuse of packaging materials. Finally the mechanisms are explored to mitigate problems that arise from this type of waste: how research, education, incentive programs, taxes, and regulations can reduce the quantity and reduce the processing difficulties of this disposed material, yet save the natural resources from which packages are made.

CHEMICAL IDENTIFICATION OF THE ODOR COMPONENTS IN DIESEL ENGINE EXHAUST.
Final rept. for year 3.

Jun 71, 139p* ADL-62561-5 APTD-0803
Contract EPA-EHSD-71-18
See also rept. for year 2, PB-194 144.

Descriptors: (*Air pollution, Exhaust gases), (*Exhaust gases, *Odors), (*Gas chromatography, Exhaust gases), Diesel engines, Particles, Aromatic compounds, Kerosene, Automotive fuels, Aromatic polycyclic hydrocarbons, Naphthalene compounds, Aromatic monocyclic hydrocarbons, Naphthols.
Identifiers: *Diesel engine exhaust, Indans, Indenes.

The results of a continuing effort to chemically identify the odor components of diesel exhaust are reported. The basic methodology for characterizing and analyzing the diesel exhaust odor was developed during the previous effort on this program. The approach developed involved sensory characterization as an integral part of the study. The experimental approach for analysis of the odor species was to collect large volumes of exhaust by condensation at 0C, extract the organic portion of the exhaust from the non-odorous portion by liquid column chromatography. During this current program, the details of the methodology required for identification of the smoky-burnt odor fraction were completed and applied to the analysis of this fraction. All of the odor-significant species in this fraction have been identified. While several paraffinic oxidation products were recognized as important odor contributers, the most important smoky-burnt odor species are those associated with the partial oxidation products of compounds found in the aromatic fraction of the diesel fuel. Descriptors: (*Air pollution, *Monitors), (*Sulfur dioxide, Monitors), (*Oxidizers, Monitors), (*Ozone, Monitors), (*Hydrogen sulfide, Monitors), (*Nitrogen dioxide, Monitors), Gas detectors, Performance evaluation, Field tests, Chemiluminescence, Photometers, Colorometers, Coulometers, Flame photometry, Diurnal variations, Tables (Data), Mobile equipment, California.
Identifiers: *Air pollution detection, Air quality data, Los Angeles (California).

The results are reported of a program of which the objective is to conduct a full scale field evaluation in different geographical areas to determine the effects on the response of ambient air analyzers of typical combinations of pollutants in an urban environment. Instruments for measuring SO2 and oxidant in the Los Angeles environment are the principle subjects of the report. Instruments and methods being evaluated include a Gas Phase Chemiluminescent Ozone Photometer, Solid Phase Chemiluminescent Ozone Photometer, a Coulometric Oxidant Analyzer, a Colorimetric Oxidant Analyzer, a Flame Photometric SO2 Analyzer, an Automated West-Galke SO2 Monitor, an Automated GC-FPD SO2, H2S Analyzer, a Coulometric SO2 Analyzer, a Colorimetric NO2 Analyzer, and a Colorimetric H2S Analyzer. Supporting meteorological instrumentation includes wind speed and direction, temperature, solar radiation, and humidity sensors.

CHARACTERIZATION AND IDENTIFICATION OF SPILLED RESIDUAL FUEL OILS BY GAS CHROMATOGRAPHY AND INFRARED SPECTROPHOTOMETRY.
Interim rept. 1969-1971,
F. K. Kawahara. Oct 71, 48p EPA-16020-MAZ

Descriptors: (*Water pollution, Oils), (*Gas chromatography, Fuel oils), (*Infrared spectroscopy, Fuel oils), (*Law enforcement, Water pollution), Spectroscopic analysis, Infrared spectra, Mixtures, Alkanes.
Identifiers: *Oil pollution detection.

Oil discharges and spills from industrial plants and ships impart unpleasant tastes and odor to water and to game fish and fowl, as well as affect the amenities of beach and recreational facilities. For enforcement actions, it has been useful not only to identify the source of oil spills in the streams, but also to characterize first the petroleum product involved. Methods developed in the last two years at the Analytical Quality Control Laboratory are described; the author presents a workable scheme for the characterization and identification of residual oil pollutants found in surface waters. A powerful aid for the characterization of fuel oil products is stressed. Identity with gas chromatographic and infrared data is given in an elaborate fashion and comparisons are made in the absence of extremely expensive analytical equipment.

Identifiers: *Tertiary sewage treatment, Lake Tahoe, Water pollution control.

A 7.5 mgd advanced wastewater treatment plant at South Lake Tahoe, California has been in uninterrupted operation for three years. Chemical treatment, mixed media filtration, and granular carbon adsorption have been shown to be efficient, reliable, and economical processes for wastewater treatment. A degree of reliability and flexibility comparable to that achieved in electric power generation and water purification has been achieved by appropriate selection and sequencing of unit processes and proper plant design. Plant bypasses have been elimated. Bacteria and viruses have been entirely eliminated from the effluent by small chlorine dosages. Lime has been recalcined in a multiple hearth furnace without air pollution, and granular activated carbon has been successfully regenerated and reused, with stack gasses scrubbed to meet air pollution standards. The wastewater treatment cost has been approximately twice the cost of conventional wastewater treatment.

Contract FWPCA-14-12-800
Paper copy available from GPO $0.55 as EP2.10:17010EED07/70.

Descriptors: (*Chemical removal (Sewage treatment), *Ammonia), (*Sewage treatment, Chemical removal (Sewage treatment)), (*Oxidation, Ammonia), Electrochemistry, Catalysts, Electrodes, Nitrogen, Electrolytic cells, Fluid flow, Platinum.

Laboratory tests were conducted to determine the feasibility of electro-oxidation as a means of removal of ammonia from wastewaters. It was determined that, under conditions of ammonia concentration and pH typical of treatment effluents, the electro-oxidation reaction proceeded stoichiometrically to nitrogen and no other oxidation products. Oxidation occurred in concentrations as low as 2 mg/l of ammonia. Using platinized platinum as an electrode, ammonia decomposition occurred in a narrow potential range with high coulombic efficiency, assuming a three-electron exchange per ammonia molecule. Conversion of nitrogen to the elemental form was demonstrated by analysis of the gas from the anode. No detectable quantities of nitrite, nitrate hydrazine, and hydroxylamine were discovered in the gas. Electric power costs were estimated at $.01/1000 gallons, but cost of the platinum electrodes was prohibitive. Experiments with other electrodes were unsuccessful. Unless less expensive electrodes are developed, the process cannot be economically competetive with other methods.

NITRATE REMOVAL FROM WASTEWATERS BY ION EXCHANGE.
Water pollution control research series,
Robert R. Grinstead. Jan 71, 103p W72-01495, EPA-WQO-17010-FSJ-01/71
Contract FWPCA-14-12-808
Paper copy available from GPO $1.00 as EP.210:17010FSJ1/71.

Descriptors: (*Nitrates, *Chemical removal (Sewage treatment)), (*Amidines, *Anion exchanging), (*Sewage treatment, *Denitration), Alkalinity, pH, Cost estimates, Anion exchange, Guanidines, Adsorption, Materials recovery, Regeneration (Engineering), Sodium hydroxides.
Identifiers: Tertiary sewage treatment.

Alkylated amidines dissolved in an aromatic hydrocarbon were absorbed in macro-porous polystyrene beads to form a water-immiscible extractant system for the removal of nitrate from wastewaters. The amidines are relatively strong bases and possess the advantage over the simple aliphatic amines that they exist in the salt form in contact with wastewaters in the pH range of 7.0 to 8.0. They can, however, be readily regenerated with alkalis, such as ammonia or sodium hydroxide. Amidinium ion in the organic phase selectively extracts nitrate ion over chloride ion by a factor of about 20 (nitrate/chloride ratio in the organic phase is about 20 times the ratio in the equilibrium aqueous phase), and nitrate over sulfate and bicarbonate by much higher ratios. Therefore, amidine systems will pick up mainly nitrate ion from municipal wastes. Seventy bed volumes of a synthetic municipal wastewater containing 62 ppm nitrate ion and 350 ppm chloride ion were treated before breakthrough of nitrate ion in the effluent. Processing costs were estimated currently at 16 cents/1000 gal.

Contract CPA-70-68

Descriptors: (*Air pollution, Sulfur dioxide), (*Air pollution control equipment, *Sulfur dioxide), (*Electric power plants, Air pollution control equipment), Cost comparison, Design criteria, Cost estimates, Capital costs, Operating costs, Waste disposal, Performance evaluation, Limestone, Scrubbers, Adsorbents, Carbonates, Formates, Ammonia, Magnesium oxides, Zinc oxides, Citrates, Fertilizers, Flue gas, Materials recovery.
Identifiers: *Air pollution control, *Waste gas recovery, Cat-Ox process, Molten carbonate process, Claus process, Potassium formate process, Ammonia scrubbing, TYCO process, Magnesium oxide scrubbing, Zinc oxide process, Citrate process.

The results are reported of technical and economic evaluations of the feasibility of different SO2-control processes. In addition to process evaluations, studies were made of; the applicability of these processes to both power plants and SO2-control processes, and the impact SO2-control technology would have on emission reduction. Preliminary process designs and economic evaluations have been prepared for twelve different SO2-control processes. Investments are reported in millions of dollars for a 1,000 MW plant so the investment cost in dollars per Kilowatt has the same value. The operating costs are reported as dollars per ton of sulfur not emitted, as mills per Kilowatt-hour, and as a percent increase of power cost. Of the twelve processes evaluated none can be ranked as commercially available at the present time. (Author)

CHARACTERISTICS AND POLLUTION PROBLEMS OF IRRIGATION RETURN FLOW.

May 69, 250p W72-01984, EPA-WQO-13030-05/69
Contract DI-14-12-408
Prepared in cooperation with Robert S. Kerr Water Research Center, Ada, Oklahoma.

Descriptors: (*Water pollution, *Surface waters), (*Irrigation, Water pollution), Reviews, Ground water, Water quality, Nutrients, Soil chemistry, Law (Jurisprudence), Salinity, Sources, Stream pollution, Rivers, Sediments, Pesticides, Water resources.
Identifiers: Irrigation return water.

An extensive review of the literature was made to assess the present state of scientific knowledge and technology regarding water pollution problems associated with the practice of irrigation and occurring in irrigation return flow. The effect of irrigation on the subsequent reuse of water by other users was considered. Feasibility studies have been conducted on treating and disposing of return water. A need was found for economic research explicitly concerned with irrigation return flow. The legal aspects of reuse and water

quality of irrigation return flows were examined and the recommendation made for more intensive study of the inseparable nature of quality-quantity management in relation to institutional, economic, and legal restrictions. The article contains 245 references and a separate bibliography of 700 entries.

Contract FWPCA-14-12-28
Prepared in cooperation with Robert S. Kerr Water Research Center, Ada, Oklahoma.

Descriptors: (*Water pollution, *Agricultural wastes), (*Livestock, Agricultural wastes), Reviews, Beef cattle, Poultry, Swine, Recommendations, Trends, Public health, Ground water, Rivers, Waste disposal, Sewage treatment, Fertilizers, Incinerators, Cost estimates.
Identifiers: Manure, *Feedlot wastes, *Solid waste disposal, Water pollution control.

The purpose of the review is to present a forward oriented state-of-the-art of pollutional implications which must be faced with the ever increasing trend toward confinement feeding large numbers of livestock. The manure wastes from all varieties of livestock under feed in the United States are characterized and related both to human population equivalents and beef cattle equivalents. The potential environmental hazards which may result from improper handling, storage, and disposal of these wastes were discussed. The effectiveness and economics of various conventional wastes treatment and disposal methods as related to confinement feeding wastes were evaluated.

CHEMICAL REMOVAL OF NITROGEN AND ORGANIC SULFUR FROM COAL.
Final rept.,
R. A. Meyers, J. S. Land, and C. A. Flegal. 14 May 71, 62p* 17270-6007-RO00 APTD-0845
Contract EPA-EHSD-71-7

Descriptors: (*Coal preparation, Solvent extraction), (*Desulfurization, Coal), Nitrogen organic compounds, Sulfur organic compounds, Organic acids, Nitrobenzenes.
Identifiers: Air pollution control, *Denitrification.

Techniques for extracting organic sulfur and nitrogen compounds from coal without significantly altering the remainder of the coal matrix were tested in the laboratory. The concept for chemical removal of organic sulfur and nitrogen is feasible. Weak organic acids remove 45-80% of the organic sulfur from the coals investigated depending on process conditions and the specific coal leached. Nitrobenzene appears to be the most efficient solvent for the removal of organic sulfur. Aqueous caustic removes small amounts of organic sulfur from some coals, but none from others. Particle size (-200 mesh to 1/2-inch) has no discernable effect on the removal of organic sulfur by nitrobenzene. The leaching solvent, nitrobenzene, may be recycled at least three times to remove organic sulfur from coal. Weak organic acids and strong inorganic acids appear to remove nitrogen from the coals tested in this program according to the Dumas analytical method, but no nitrogen is removed according to the Kjeldahl method. Weak organic acids for removal of organic sulfur from coal may be readily adapted to engineering process schemes. The cost of the process for removal of organic sulfur from coal is highly dependent on the degree of solvent loss, and the ability to recycle solvent and allow high sulfur compound buildup. The process cost for removal or organic sulfur is approximately $1.00-$1.50/ton of coal. (Author)

Identifiers: *Aircraft exhaust.

Descriptive accounts are presented of statistical procedures which were applied to the analysis of mass emissions data as determined from aircraft exhaust emissions measurements. Results of these analyses are discussed, with an emphasis on the significance of the results within the context of the data base available. In essence, the purpose of the report is to isolate the causes or sources of both fixed and random contributions to the variability observed in the data and to estimate, wherever possible, the magnitudes of these contributions. Specific questions of broad interest are addressed and statistical inferences drawn with respect to these questions. (Author)

A GUIDE FOR REDUCING AUTOMOTIVE AIR POLLUTION.

Nov 71, 81p* APTD-0837
Contract EPA-CPA-70-100
Prepared in cooperation with Ryckman, Edgerley, Tomlinson and Associates, St. Louis, Mo.

Descriptors: (*Air pollution, Exhaust gases), (*Highway transportation, *Exhaust gases), (*Vehicular traffic control, Air pollution), Urban planning, Regulations, Traffic engineering, Taxes, Parking facilities.
Identifiers: *Automobile exhaust, Air pollution control.

A guide is presented which is designed to aid transportation professionals and state air pollution control agencies in selecting transportation controls suggested in the regulations pursuant to the Clean Air Act of 1970. Actions considered here emphasize the reduction of traffic volume and congestion and can be implemented within five years. The guide outlines the laws and regulations that require assessment of the air pollution impact of transportation. It then discusses the following techniques for improving traffic flow: freeways, arterials, and downtown distribution. Also discussed are techniques for reducing the concentration of pollution and for reducing auto traffic.

INSTRUMENTATION FOR THE DETERMINATION OF NITROGEN OXIDES CONTENT OF STATIONARY SOURCE EMISSIONS. VOLUME I,
Leo P. Parts, Paul L. Sherman, and Arthur D. Snyder. Oct 71, 75p* MRC-DA-307 APTD-0847
Contract EPA-EHSD-71-30

Descriptors: (*Air pollution, Nitrogen oxides), (*Gas detectors, *Nitrogen oxides), (*Flue gases, Air pollution), Reviews, Monitors, Performance evaluation, Cost estimates, Infrared spectroscopy, Ultraviolet spectroscopy, Potentiometric analysis, Chemiluminescence, Gas chromatography, Raman spectroscopy, Mass spectroscopy, Light scattering.
Identifiers: *Air pollution detection, Laser spectroscopy, Photoionization.

Information regarding the state-of-the-art of NO (x) (x = 1 to 2) monitoring instrumentation has been assembled and evaluated. The evaluation was based on the present and projected requirements in stationary source emissions monitoring, the operational characteristics and performance capabilities of the instruments, and on the cost/performance criteria. Commercially available and prototype instruments, and laboratory-stage instrumental methods are covered. Instruments based upon wet chemical methods were excluded. The design and operational features of seven instruments which are undergoing laboratory and on-site evaluation at a fossil fuel burning installation are described. Sixteen other NO (x) analysis concepts were also evaluated. Chemiluminescence, correlation spectrometry, mass spectrometry and selective photoionization have been identified as the preferred analysis methods upon which new NO (x) emissions monitoring instruments can be based, using currently available technology, to meet the performance requirements. Novel and potentially useful monitoring techniques, based on the evolving laser technology, were identified.

Contract EPA-68-04-0011

Descriptors: (*Air pollution, Exhaust gases), (*Aircraft engines, *Exhaust gases), (*Air pollution control equipment, Aircraft engines), Standards, Jet engines, Spark ignition engines, Aviation fuels, Monitors, Efficiency, Gas detectors, Cost effectiveness, Nitrogen oxides, Sulfur dioxide, Hydrocarbons, Particles, Odor control, Smoke abatement, Terminal air traffic control.
Identifiers: *Aircraft exhaust.

The results are presented of an investigation which was aimed at providing information for establishing standards on emissions from aircraft activities. The program consisted of independent investigation of the following topics: Emission control by engine modification; Emission control by ground operations modification; Emission control by fuel modification; and Emission measurement. Engine modification control methods were identified through reviews of earlier work and through discussions with engine manufacturers. A list of specific control methods was formulated on the basis of preliminary analyses in which feasibility was indicated. The preliminary list of control methods was then subjected to more detailed analysis of control effectiveness and implementation costs. Ground operations modification control methods were evaluated in a similar manner.

ANALYSIS OF AIRCRAFT EXHAUST EMISSION MEASUREMENTS.
Technical rept. Jun-Sep 71,
Leonard Bogdan, and H. T. McAdams. 15 Oct 71, 643p CAL-NA-5007-K-1 APTD-0851
Contract EPA-68-04-0040

Descriptors: (*Air pollution, *Exhaust gases), (*Aircraft engines, Exhaust gases), Data processing, Standards, Carbon monoxide, Hydrocarbons, Nitrogen oxides, Take off, Landing, Taxiing, Jet engines, Spark ignition engines, Turboprop engines, Editing routines.
Identifiers: Air pollution standards, *Aircraft exhaust.

An account is presented of the analytical procedures and data processing techniques employed in translating field-measurement data of aircraft exhaust emissions into a form consistent with the needs for the promulgation of realistic standards. Pollutant mass emissions for carbon monoxide (CO) hydrocarbons (HC) and the oxides of nitrogen (NO (x)) are computed for an aircraft operational cycle comprised of the following modes: taxi/idle, take-off, climb out and approach. The calculations are for specific engine power (or thrust) settings for each mode as well as for specified times in mode. Numerical results are tabulated for each individual engine tested together with summaries obtained by aggregating engine data on a model basis. Data are presented for turboprop/turbine engines, light-utility piston engines and auxiliary power units. (Author)

EXHAUST EMISSIONS TEST AIRESEARCH AIRCRAFT PROPULSION AND AUXILIARY POWER GAS TURBINE ENGINES.
Test rept.

10 Sep 71, 420p GT-8747-R APTD-0849

Descriptors: (*Air pollution, Exhaust gases), (*Gas turbine engines, *Exhaust gases), (*Aircraft engines, Exhaust gases), Monitors, Standards, Hydrocarbons, Carbon monoxide, Carbon dioxide, Nitrogen oxides, Gas turbine power generation, Auxiliary power plants, Gas detectors, Jet engines.
Identifiers: *Aircraft exhaust, Air pollution standards.

The report describes the test setup, procedure, and analysis of exhaust emissions measurement conducted on 32 commercial gas turbine engines comprised of both on-board aircraft auxiliary power and aircraft propulsion production, overhaul, and development units. The units selected are currently active in commercial airline service and thus contribute to aircraft related pollution levels. The purpose of this test was to measure exhaust emissions from auxiliary power and small aircraft propulsion gas turbines engines to establish base levels of unburned hydrocarbons, carbon monoxide, carbon dioxide and oxides of nitrogen in current existing engine designs. In addition, a survey of engine duty cycles as related to normal customer operation in the field was made to determine a typical duty cycle and the corresponding estimated level of exhaust emissions produced. Contract PH-86-67-265
Library of Congress Catalog card no. 70-611464.

Descriptors: (*Waste disposal, *Materials recovery), Utilization, Refuse disposal, Feasibility, Performance evaluation, Cost estimates, Material separation, Separators, Magnetic separators, Comminution, Vibrating screens, Flotation machines, Jigs (Concentrators), Fluidized bed processors, Incinerators, Composts, Heat recovery, Pyrolysis, Cans, Paper, Glass, Rubber, Protein, Food.
Identifiers: *Waste recycling, *Solid waste disposal, Food supplements.

The report compiles available cost and performance characteristics of processes that are, or might be, employed in solid waste recovery and utilization. The information was obtained from operators of existing systems, equipment manufacturers, and selected experts and the study is focused on size reduction, separation, and recovery and utilization. Among the conclusions, it was found that more than two-thirds of size reduction equipment is used primarily on uniform material in industry and is not recommended for direct use on municipal solid waste; with the exception of magnetic separation, the degree to which the separation techniques studied can be adopted in practice is not well established because of the lack of suitable cost and performance data upon which to base evaluations; in the area of recovery and utilization of mixed solid waste, byproduct recovery appears to have greater economic potential than does material salvage.

Identifiers: *Foam flotation, *Water pollution control.

The clean-up of waste waters in municipal water supplies is ultimately a separation problem involving the removal of pollutants. Thus there is continual interest in finding new separation methods for potential use in this application. The reported research explored the applicability of three separation processes to water pollution control: Colloid flotation for removal of clay materials; Coagulated ion exchange resin for removal of electrolyte; and Adsorbing colloid flotation for removal of electrolyte again. The report details each of these studies separately. Some of the important factors controlling separation for each method are described and potential applications to waste water treatment field are presented and suggested. (Author)

ELECTRICAL INDUCTION OF PARTICULATE AGGLOMERATION.
Final rept., on Task 7,
J. R. Melcher, and K. S. Sachar. 10 Aug 71, 64p* APTD-0869
Contract EPA-68-002-018

Descriptors: (*Particles, *Agglomeration), (*Dust control, *Air pollution control equipment), (*Electrostatic precipitation, Agglomeration), Electric fields, Particle size, Feasibility, Applications of mathematics, Gas flow.

The report presents results dealing with the role of electric fields in agglomeration processes. The objectives relate to agglomeration characterized as follows: The gas-entrained particulate includes particles of both signs, so that charge neutrality on the macroscale is preserved; Two families of particle sizes are used. It is agglomeration between fine particulate and large particles that is of interest through the microfields existing between these particles. The objectives were to provide theoretical estimates of the feasibility of using the agglomeration process described above, in a practical conditioning device; to glean what evidence there is from the literature that such agglomerative interactions occur; to make preliminary experimental tests to demonstrate the type of agglomeration of interest.

Identifiers: *Air pollution control.

The report summarizes recent developments in laser-illuminated instrumentation for measuring particulate density distributions in an operating coal-fired steam boiler. The work is a continuation of a previous effort which was concerned with applying single beam (Gabor) pulsed ruby laser holography to the recording of particulates over extreme distances. The present work attempts to determine if limestone dust in the presence of flyash background could be recorded holographically via back or side scattering of a ruby laser beam. To investigate the feasibility of making holograms of side or back scattering of a ruby laser beam, a mathematical model was first derived. This model related 4 factors which gives the transmittance along the scattering path from the laser to a detector and allows analysis of experimental measurements.

Descriptors: (*Zinc sulfates, *Chemical removal (Water treatment)), (*Textile industry, Industrial waste treatment), (*Industrial waste treatment, Zinc sulfates), (*Materials recovery, Zinc sulfates), Materials recovery, Spinning (Staple fibers), Textile processes, Precipitation (Chemistry), Pilot plants, Neutralizing, Sludge, Cost estimates, Operating costs, Utilization, Rayon.
Identifiers: *Water pollution control, Zinc hydroxides.

A zinc recovery system was developed to recover zinc from dilute zinc sulfate lost both when acid spun yarns are washed and at various stages in the spinning process. The process included neutralization of the waste stream to pH 6.0, sedimentation of insolubles, crystallization of zinc hydroxide in a high pH environment, sedimentation of zinc hydroxide and solubilization of the zinc with sulfuric acid. A pilot plant was constructed and operated. It obtained 98-99% removal efficiency. The zinc hydroxide sludge was easily concentrated. Operating and maintenance costs were estimated. Recovery and sale of 2000 lbs of zinc daily assures recovery of these costs.

Descriptors: (*Lubricating oils, Reprocessing), (*Waste disposal, Materials recovery), (*Materials recovery, Lubricating oils), Vacuum distillation, Refining, Lubricant additives, Diesel fuels, Metals, Cost estimates, Chemical engineering.
Identifiers: *Waste recycling, Liquid waste disposal.

A simplified technique for reprocessing spent automotive crankcase oils into useful petroleum products other than lube oils, without producing residues which cause water pollution was demonstrated. All of the petroleum products from vacuum distillation of the waste oils were sold as low sulfur heating fuel as potential diesel fuels. Only the water in the fuel was not recovered. Varying composition of the waste oils accounted for much of the operation difficulty encountered. Metal based additives caused numerous clogging problems. Feed variability plus increasingly stringent effluent laws resulted in obsolescence of the plant before test runs were finished. Use of the waste oils in the plant was extremely damaging to the equipment, resulting in much greater yearly depreciation than was anticipated.

Jul 71, 136p W72-02367, EPA-WQO-15080-FWN-07/71
Contract EPA-WQO-14-12-883
Paper copy available from GPO $1.25 as EP2.10:15080-FWN-07/71.

Descriptors: (*Water pollution, Oils), (*Oils, *Skimmers), (*Materials recovery, Oils), Disks (Shapes), Tests, Fuel oil, Bunker oils, Performance evaluation, Theories.
Identifiers: *Oil pollution removal.

Laboratory tests indicated the feasibility of recovering 50,000 gal. of oil per hour using a series of powdered metal discs approximately 7 ft. in diameter and 12 ft. long. Testing included various oils ranging from light diesel oil to Bunker 'C' grade oil. Oil spread as thinly as 1.5 mm in thickness was amenable to collection, but recovery efficiency greatly improved with increased thickness. Herding of the oil with booms, as well as current, whether natural or caused by towing the disc unit through the oil, were shown to increase the oil thickness. Oil starvation, in the form of insufficient oil contacting the disc was shown to be a significant problem, but recovered oil still contained only around 2% moisture, eliminating the need for a separator. Wave action was shown to actually enhance pick-up.

Descriptors: (*Air pollution, *New Mexico), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Albuquerque (New Mexico), *Bernalillo County (New Mexico).

A summary report is presented of the Albuquerque, New Mexico area air pollutant inventory. The study area consists of one complete county, Bernalillo, and portions of three others, Sandoval, Socorro, and Valencia. The area covers approximately 5,700 square miles and had a 1969 population of 365,000. A grid coordinate system was used to show the geographical distribution of emissions within counties. All sources of emissions were classified into five categories: transportation, stationary fuel combustion, solid-waste disposal, industrial processes and evaporative fuel losses. Each of these categories was divided into point sources and area sources.

Identifiers: *Air pollution episodes, *Air pollution public emergency limits, *Emergency planning, *Implementation Air Pollution Planning Program.

The objective of the Alabama Emergency Episode Plan is to prevent the occurrence of adverse pollutant levels and is designed for the emergency control of the following pollutants: total suspended particulates; oxides of sulfur, carbon monoxide, oxides of nitrogen, photochemical oxidants, and total hydrocarbons. The plan is viewed as a mechanism for reducing high pollution levels by reducing source emissions in a well-structured manner. It is definitive with regard to sources in existence at the date of promulgation. The plan defines measures to be taken by designated agencies and officials of the State of Alabama and cooperating organizations for protection of the health of persons during air pollution episodes. An episode communications manual is included as an appendix to this plan. (Author)

Descriptors: (*Air pollution, *Alabama), (*Government policies, Air pollution), Regulations, State government, Abatement, Law enforcement, Standards, Licenses, Planning, Particles, Carbon monoxide, Sulfur oxides, Nitrogen oxides, Hydrocarbons, Oxidizers, Abatement.
Identifiers: *Air pollution standards, *Implementation Air Pollution Planning Program, Emergency planning, Air pollution control.

The state of Alabama is required under the Clean Air Act to adopt and enforce the national air quality standards for sulfur oxides, particulate matter, carbon monoxide, photochemical oxidants, hydrocarbons and nitrogen dioxide. The proposed Rules and Regulations presented, fulfills these requirements. These rules and regulations provide general measures as well as specific guidelines necessary for the attainment and maintenance of air quality standards for the State of Alabama. The permit system, control regulations, and the episode plan are defined and discussed with their respective rules. (Author)

DEVELOPMENT OF HIGH-ENERGY BATTERIES FOR ELECTRIC VEHICLES.
Progress rept. Jul 70-Jun 71,
E. J. Cairns, R. K. Steunenberg, J. P. Ackerman, B. A. Feay, and D. M. Gruen. Jul 71, 98p* APTD-0875

Descriptors: (*Storage batteries, Design criteria), (*Electric vehicles, Storage batteries), Air pollution, Battery electrolytes, Electric automobiles, Lithium, Sulfur, Molten salt electrolytes, Lithium oxides, Aluminates, Aluminum oxides, Fabrication, Tests.
Identifiers: *Lithium sulfur cells, High energy batteries.

The objective of the program described is to develop the technology required to construct secondary batteries having the performance capabilities required for pollution-free electric automobiles. Lithium/sulfur cells using a molten lithium halide-containing electrolyte and operating at 360 to 390 C have achieved capacity densities of up to 0.52 A-hr/sq cm (above 1 V) at a current density of 0.52 A/sq cm. The cell development program is supported by laboratory studies in various areas. The solubility of cathode materials in various electrolytes and the identity of the soluble species are studied. Preliminary results indicate that electrolytes containing only fluoride and chloride anions have the lowest solubility for sulfur-bearing species. A survey of candidate solid electrolytes has led to the investigation of the lithium form of B-alumina. Investigations were made of the corrosion rates of various materials at 375 C, and battery design and performance calculations were carried out for a 1075-lb Li/s battery in a 4300 lb electric automobile. BATON ROUGE METROPOLITAN AREA AIR POLLUTANT EMISSION INVENTORY,
Alan J. Hoffman. Jan 70, 29p* APTD-0866

Descriptors: (*Air pollution, *Louisiana), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Baton Rouge (Louisiana), Iberville County (Louisiana), Ascension County (Louisiana), Saint James County (Louisiana).

A summary report is presented of the Batom Rouge, Louisiana area air pollutant emission inventory. The study area consists of five parishes along the river extending up to Baton Rouge from New Orleans. The pollutants, which include sulfur oxides, particulates, carbon monoxide, hydrocarbons, and nitrogen oxides are delineated with respect to source type, season of the year and geographical distribution within the area. The general procedure for estimating the surveys is based on the rapid survey technique for estimating air pollutant emissions. (Author)

BSR-3027 APTD-0889
Contract CPA-22-69-55

Descriptors: (*Infrared spectroscopy, *Gas detectors), (*Air pollution, Gas detectors), (*Ozone, Gas detectors), Spectroscopic analysis, Infrared spectrophotometers, Monitors, Urban areas, Data processing, Sulfur dioxide, Computer programming, Background discrimination, Remote sensing.
Identifiers: *Air pollution detection.

A long-path spectrophotometric instrument is described for the quantitative measurement of ozone and other infrared absorbing gases (such as sulfur dioxide) in unconfined ambient air. A continuous variable filter wheel is used for wavelength selection from 7 to 14 microns. The instrument can be used with an active source at a range from 0.4 to over 1.6 km or it can be used to examine passively the radiant emittance from natural sources. A minicomputer is programmed to control the instrument and analyze the data in real time. The output of spectra or pollutant concentration is on a cathode ray tube, a teletypewriter, and/or punched paper tape. The instrument is sensitive to ozone concentrations ranging from 20 microgram/cu. m. (0.01 ppm) to 2000 microgram/cu. m. (1 ppm), with a measured noise of less than 4 microgram/cu. m. and a time constant of about two minutes. (Author)

TRIANGLE METROPOLITAN AREA AIR POLLUTANT EMISSION INVENTORY (RALEIGH--DURHAM-CHAPEL HILL),
Alan J. Hoffman, and Gabriel Marciante. Aug 70, 79p APTD-0834

Descriptors: (*Air pollution, *North Carolina), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Raleigh (North Carolina), *Durham (North Carolina), *Chapel Hill (North Carolina), *Orange County (North Carolina), *Durham County (North Carolina), *Wake County (North Carolina).

The report presents a summary of a Raleigh-Durham-Chapel Hill, North Carolina air pollution emission inventory. The survey provides estimates of the present magnitude, extent and sources of air pollutant emissions and the status of their control. The following pollutants are considered: sulfur ox-

ides, particulates, carbon monoxide, hydrocarbons, and nitrogen oxides. A grid coordinate system was used to show the geographical distributions of emissions within counties. All sources of emissions were classified into five categories: transportation, stationary fuel combustion, solid waste disposal, industrial processes and evaporative losses. (Author)

RENTAL VEHICLE SURVEILLANCE PROGRAM; MARCH 1968 TO JANUARY 1970,
Daniel B. Pinkert, James M. Marzen, and Charles J. Domke. Nov 71, 25p AP-97
Paper copy available from GPO $0.25 as EP4.9:97.

Descriptors: (*Exhaust gases, Surveys), (*Motor vehicles, Exhaust gases), (*Air pollution, Exhaust gases), Test methods, Standards, Carbon monoxide, Hydrocarbons, Gasoline engines, Automobile engines, Statistical data.
Identifiers: Federal exhaust emission standards.

Exhaust-emission tests were performed on rental vehicles representing 26 vehicle types to ascertain the effectiveness of the Federal exhaust emission standards. Most of the rental vehicles tested had odometer readings of less than 15,000 miles, and had received no engine maintenance other than minor carburetor adjustments. Approximately half the cars with odometer readings in excess of 15,000 miles had received one engine tune-up during their fleet operation. All vehicles were tested by the standard Federal seven-mode, seven-cycle cold-start test procedure, and by the New Jersey ACID cycle test and the Clayton Key Mode test. (Author)

CHITTENDEN COUNTY AIR POLLUTANT EMISSION INVENTORY,
Glenn Aiken, and Thomas W. Fitzpatrick. Oct 69, 56p APTD-0839

Descriptors: (*Air pollution, *Vermont), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Chittenden County (Vermont), Burlington (Vermont).

The report is a compilation of air pollutant emissions in the Chittenden County Area, Vermont. The objective of the emission inventory is to determine the quantity of various air pollutants emitted, as well as delineate their geographical variations. The pollutants considered in this survey were: aldehydes, oxides of nitrogen, carbon monoxide, hydrocarbons, organic acids, oxides of sulfur, and particulate matter. Data gathered herein are primarily representative of 1968. The Study Area consists of the Greater Burlington Area and the surrounding towns of Bolton, Charlotte, Colchester, Hinesburg, Huntington, Jericho, Milton, Richmond, Shelburne, St. George, Underhill, Westford, and Williston. A MATHEMATICAL MODEL FOR RELATING AIR QUALITY MEASUREMENTS TO AIR QUALITY STANDARDS,
Ralph I. Larsen. Nov 71, 61p AP-89
Paper copy available from GPO $0.60 as EP4.9:89.

Descriptors: (*Air pollution, Statistical analysis), (*Atmospheric composition, Statistical analysis), Mathematical models, Statistical distributions, Monitors, Standards, Carbon monoxide, Hydrocarbons, Nitrogen oxides, Oxidizers, Sulfur dioxide, Particles, Tables (Data), Urban areas.
Identifiers: Air quality data, *Air pollution sampling, Air pollution standards.

Analyses of air pollution data indicate that air quality measurements tend to fit a general mathematical model having specific characteristics. These characteristics have been used to develop equations that may be employed to calculate the geometric mean, standard geometric deviation, maximum concentration, and various percentile concentrations of air pollutants. To illustrate the predictive, as well as the interpretive value of the model, parameters have been first calculated for one averaging time from actual data and then calculated for other averaging times by means of the model. Maximum concentrations with the model are compared with measured values for seven gaseous pollutants obtained during continuous sampling for up to 7 years in eight cities. The resulting information can be used in developing implementation plans and emission standards. All the equations needed for performing the calculations are listed.

THE FEASIBILITY OF USING COLOR AERIAL PHOTOGRAPHY TO DETECT AND EVALUATE SULPHUR DIOXIDE INJURY TO TIMBER STANDS.
Forest Service research note.
Kristina A. Zealer, Robert C. Heller, Nancy X. Norick, and Marilyn Wilkes. Nov 71, 160p APTD-0865

Descriptors: (*Air pollution, Sulfur dioxide), (*Infrared photography, *Plant diseases), (*Sulfur dioxide, Plant diseases), Color photography, Trees (Plants), Forest land, Airborne detectors, Photointerpretation, Feasibility, Alabama.
Identifiers: *Air pollution effects (Plants).

A feasibility study was undertaken in Alabama near a point source of sulphur dioxide, emissions to determine the best film-filter-scale combination of aerial photography to evaluate SO2 injury to forest vegetation. Normal color film, exposed through a didymium filter, at very large scales (1:800 and 1:1,584) proved to be the most accurate sensor. Color infrared film was almost as good. Interpreter differences were least at large scale and on color film. Ground variables which were best correlated with photo interpretation were: crown color, needle color, Munsell hue, percent of current needles with tip dieback and the length of the tip dieback. A combination of photo and ground plots appears to be the most efficient design for measuring these effects--especially if done over large areas.

Report on Water Pollution Control Research Series.
Paper copy available from GPO$0.50 as EP 2.10:17010EAP10/70.

Descriptors: (*Chemical removal (Sewage treatment), *Phosphates), (*Sewage treatment, *Ion exchanging), (*Tin organic compounds, Ion exchanging), Solvent extraction, Organic solvents, Ferrocene, Organometallic compounds, Synthesis (Chemistry).
Identifiers: *Liquid ion exchanging, Benzene sulfonates, *Stannane carboxylic acid/tribenzyl, Stannane/hydroxy-tribenzyl.

The liquid ion exchange extraction process has been used consistently for removing small quantities of uranium, vanadium, copper and other metals in sewage treatment. In successful tests of the ability of liquid ion exchange to remove alkylbenzene sulfonate (ABS) from sewage plant effluents, it was discovered that some phosphorus was removed also. Various metal-containing organic compounds were screened for their activity as liquid ion exchange reagents for phosphate. The compounds were tested for selectivity in extracting inorganic phosphate from water into organic solvents in the presence of chloride, sulfate, and bicarbonate. A tribenzyltin acetate compound was also successful in extracting phosphate.

Report on Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California. Also available as Rept. no. REC=R2-71-7.

Paper copy available from GPO $1.25 as EP 2.10: 13030 ELY 4/71-7.

Descriptors: (*Chemical removal (Sewage treatment), *Nitrates), (*Algae, *Harvesting), (*Food processing, Algae), Food, Ground water, Water pollution, Nutrients, Cost estimates, Lagoons (Ponds), Feeding stuffs.
Identifiers: *Water pollution control, *High protein supplements, Food supplements, San Joaquin Valley.

An algal system consisting of algae growth, harvesting and disposal was evaluated as a possible means of removing nitrate-nitrogen from subsurface agricultural drainage in the San Joaquin Valley of California. The study of this assimilatory nitrogen removal process was initiated to determine optimum conditions for growth of the algal biomass, seasonal variations in assimilation rates, and methods of harvesting and disposal of the algal product. A secondary objective of the study was to obtain preliminary cost estimates and process design. The growth studies showed that about 75 to 90 percent of the 20 mg/l influent nitrogen was assimilated by shallow (12-inch culture depth) algal cultures receiving 2 to 3 mg/l additional iron and phosphorus and a mixture of 5 percent CO2. The most economical and effective algal harvesting system tested was flocculation and sedimentation followed by filtration of the sediment. The market value for this product as a protein supplement was estimated to be about $80 to $100 per ton.

MOISTURE MOVEMENT IN A HORIZONTAL SOIL COLUMN UNDER THE INFLUENCE OF AN APPLIED PRESSURE.
Doctoral thesis,
William Wen-Gong Yeh. Mar 67, 129p TR-77 W72-02970, EPA-WQO-16060-03/67
Grant PHS-WP-00246

Descriptors: (*Soil water, *Water flow), Ground water, Hydraulic conductivity, Numerical analysis, Hydrology, Darcys law, Capillary pressure, Computer programs, Percolation, Theses, Permeability.

The problem under consideration is that of horizontal moisture movement in a semi-infinite column of homogeneous soil initially at a uniform moisture content and with flow introduced under a certain applied constant pressure at one end. The soil-water system is subdivided into saturated and unsaturated zones. The liquid pore pressure in the saturated zone varies linearly with distance from the applied pressure at the soil face to the critical-suction value at the interface between the saturated and unsaturated zones. RADIOLOGICAL SURVEILLANCE STUDIES AT A PRESSURIZED WATER NUCLEAR POWER REACTOR,
Bernd Kahn, Richard L. Blanchard, Harry E. Kolde, Herman L. Krieger, and Seymour Gold.
Aug 71, 105p* EPA-RD-71-1

Descriptors: (*Pollution, *Radioactive contaminants), (*Nuclear reactors, Radioactive contaminants), (*Pressurized water reactors, Radioactive contaminants), Air pollution, Water pollution, Tritium, Monitors, Radiation dosage, Public health, Cooling water, Radioactive wastes, Radioactive isotopes, Iodine isotopes, Aquatic biology, Fishes, Benthos, Wildlife, Radiation effects, Massachusetts.
Identifiers: Yankee Power Reactor.

A radiological surveillance study was undertaken at the Yankee Nuclear Power Station to make available information for calculating population radiation exposures at routinely operating commercial pressurized water reactor (PWR) stations and to demonstrate effective monitoring procedures. Radionuclide concentrations and external radiation were measured in the immediate environment of the station. At the same time, the radionuclide contents of liquids and gases at the station and of effluents at points of discharge were measured, and levels of environmental radioactivity were estimated from these values. The radioactivity in effluents at Yankee consisted mostly of 3H, in amounts typical of PWR stations that use fuel clad in stainless steel. The amounts of other radionuclides discharged to the environment from the reactor plant were very small, apparently because of effective containment of fission products other than 3H within the fuel elements and treatment of wastes by storage (for radioactive decay) and evaporation. A considerable fraction of the effluent radioactivity was discharged at the secondary coolant system because these effluents are released without treatment. (Author)

PRELIMINARY DATA ANALYSIS. 1968 NATIONAL SURVEY OF COMMUNITY SOLID WASTE PRACTICES,
Anton J. Muhich, Albert J. Klee, and Paul W. Britton. 1968, 558p EPA-SW-149-68

Descriptors: (*Waste disposal, Surveys), United States, Urban areas, Rural areas, Earthfills, Refuse disposal, Questionnaires, Land use.
Identifiers: *Solid waste disposal, Sanitary landfills.

The survey conducted in conjunction with a State and interstate planning grant program provides information on the location, types, and amounts of solid wastes being collected and their ultimate disposition. In addition to providing a waste inventory, the survey indicates the manpower, equipment, facilities, and monies required to carry out collection, reduction, and disposal activities. Data from 30 states and the District of Columbia, received before July 1, 1968, are included, as are partially surveyed Indiana, Iowa, and Kansas. National analyses are given for the community data and the land disposal sites and facilities; regional analyses are given for the community data and the land disposal sites. In addition, an urban-rural comparison is provided for the community data. (Author)

SOLID WASTE MANAGEMENT / COMPOSTING EUROPEAN ACTIVITY AND AMERICAN POTENTIAL,
Samuel A. Hart. 1968, 49p EPA-SW-2c-68
Paper copy available from GPO $0.50 as FS2.2:SO4/5.

Descriptors: (*Refuse disposal, *Composts), (*Sludge disposal, Composts), (*Western Europe, *Waste disposal), Fertilizers, Industrial plants, Utilization, Economic analysis, Marketing.
Identifiers: *Solid waste disposal, *Waste recycling, Composting.

To appraise the potential for success of future American composting operations, a study of compost utilization and compost utilization research in Germany, Switzerland, and Holland was undertaken in 1966 and 1967. During the investigation, 14 European plants were toured. Data were collected on the processing of refuse into compost, and on compost markets, plant equipment facilities, and procedures. Based on these observations, possible uses of compost in the United States are suggested. In Europe, a limited percentage of domestic refuse is composted because production costs and marketing problems make it impractical to produce more compost than can be sold. (Author)

DESIGN CRITERIA FOR HYDROGEN BURNING ENGINES.
Final rept.,
Roger J. Schoeppel. Oct 71, 157p* APTD-0901
Contract EPA-EHSH-70-103

Descriptors: (*Design criteria, Internal combustion engines), (*Internal combustion engines, *Hydrogen), Fossil fuels, Air pollution, Exhaust gases, Combustion products, Nitrogen oxide (NO), Crankcases, Ignition systems, Experimental design.
Identifiers: Hydrogen engines.

Laboratory experiments have demostrated hydrogen not only to be an excellent substitute for conventional hydrocarbon fuels in internal combustion engines but also to have the inherent qualities necessary for a permanent solution to the air pollution problem. This conclusion was reached after extensive tests were conducted with an air-cooled single-cylinder gasoline engine converted to run on hydrogen. The engine's operational characteristics compared favorable with those of its gasoline counterpart. Furthermore, the NOX content of the exhaust was an order of magnitude lower than that expected from a gasoline engine. Trace amounts of unburned hydrocarbons and carbon oxides, also present, originated from the lubricating oil. It was concluded from these experiments that a multi-cylinder automotive engine converted to run on hydrogen should be able to meet the 1975/76 Federal Emission Standards. (Author)

PILOT STUDY OF DYNAMICS OF RESERVOIR DESTRATIFICATION,
Lowell E. Leach, William R. Duffer, and Curtis C. Harlin, Jr. 1968, 37p W72-03234, FWPCA-16080-00/68

Descriptors: (*Reservoirs, Mixing), (*Aeration, Reservoirs), (*Water quality, Aeration), Stratification, Temperature gradients, Dissolved gases, Oxygen, Field tests, Limnology, Oklahoma.
Identifiers: *Thermal stratification, Destratification.

The development of a system for thermal destratification of large reservoirs is presented. Rate of change of the water volume affected and the magnitude of aeration were determined in the central pool of Eufaula Reservoir in eastern Oklahoma. The pilot system was undersized for circulating the entire volume of the central pool, yet 65,000 acre-feet of water below a depth of 22 feet was aerated by the 25th day of operation. Rate of change of hydrodynamic aeration trajectories and thermal effect versus mechanical energy input are discussed. Pilot system design and operational limitations served as a guide for design of a more effective system for continued research and development of destratification of large reservoirs. (Author)

THE COMPONENTS OF OXYGENATION IN FLOWING STREAMS,
Francis S. Stay, Jr., William R. Duffer, Billy L. DePrater, and Jack W. Keeley. Apr 67, 30p W72-03235, FWPCA-16050-04/67

Descriptors: (*Water quality, *Aeration), (*Stream pollution, Aeration), Limnology, Oxygen, Dissolved gases, Laboratory equipment, Water pollution, Photosynthesis, Air water interactions, Diffusion, Diurnal variations, Climatology, Benthos, Oklahoma.

The theory of waste assimilation in flowing streams has long been understood and, in a few cases, the application of theory has been made. A basic need in this field lies in the understanding of the behavior of the various components of reaeration and how these differ according to stream type and prevailing climatological conditions. A method is presented which can be used to separate and measure the components of reaeration in flowing waters. Plastic chambers are used to separate the effects of photosynthesis, diffusion, and respiration on the oxygen balance of a stream's regimen and further separate these parameters according to the benthos and organisms which are free-floating. Dissolved oxygen measurements were made in conjunction with supporting information such as atmospheric pressure, temperature, stream velocity profile, light intensity, and the percent of light transmittance to the benthos.

IRON-59 AS A SOLIDS TRACER IN AQUEOUS SUSPENSIONS,
Marion R. Scalf, Jack L. Witherow, and Charles P. Priesing. Oct 67, 36p W72-03236, FWPCA-16020-10/67
Presented at the ASCE Meeting, Texas Section, Held at Abilene, Tex. on 6-7 Oct 67.

Descriptors: (*Sewage treatment, *Tracer studies), (*Iron isotopes, *Labeled substances), (*Suspended sediments, Tracer studies), Radioactive isotopes, Design criteria, Lagoons (Ponds), Settling basins, Water pollution.
Identifiers: Iron 59.

Detention time is of primary importance in many waste treatment processes and probably the most universal design standard. The purpose of the paper is to introduce a radiotracer for determining the detention of particulate matter in hydraulic systems and to demonstrate simple, fast, and reliable methods of combining this tracer with dye tracers to determine the hydraulic performance of sewage treatment processes. Tracer methods using iron-59 were devised and are described for silt tracing in rivers and reservoirs, suspension tracing in lagoons, and sludge handling processes. Iron-59 almost completely adheres to particulate matter when introduced into a sewage suspension. (Author)

COLLABORATIVE STUDY OF REFERENCE METHOD FOR DETERMINATION OF SULFUR DIOXIDE IN THE ATMOSPHERE (PARAROSANILINE METHOD),
Herbert C. McKee, Ralph E. Childers, and Oscar Saenz, Jr. Sep 71, 58p* APTD-0903
Contract CPA-70-40
Errata sheet inserted.

Descriptors: (*Sulfur dioxide, *Gas analysis), (*Air pollution, Sulfur dioxide), Colorimetric analysis, Tests, Statistical analysis, Variations, Errors, Laboratories, Calibrating.
Identifiers: *Air pollution detection, Pararosaniline method.

The report presents information obtained in the evaluation and collaborative testing of a reference method for measuring the sulfur dioxide content of the atmosphere. The technique is called the pararosaniline dye method or sometimes the West-Gaeke method. Different variations of this method have been used extensively by many laboratories since the original publication in 1956, and it has been found to be reliable and reasonably free of in-

terferences. Collaborative tests were performed involving a total of eighteen laboratories. A statistical analysis of the data of fourteen laboratories provided the following results, based on the analysis of pure synthetic atmospheres using the 30-min sampling procedure and the sulfite calibration method prescribed. Results are also presented with respect to the use of control samples and reagent blank samples, the minimum number of samples required to establish validity of results within stated limits, and the statistical evaluation of various steps included in the method. The method can give satisfactory results only when followed rigorously by experienced laboratory personnel. The publication of the method in the Federal Register, April 30, 1971, as the reference method to be used in connection with Federal ambient air quality standards for sulfur dioxide is appended.

COLLABORATIVE STUDY OF REFERENCE METHOD FOR THE DETERMINATION OF SUSPENDED PARTICULATES IN THE ATMOSPHERE (HIGH VOLUME METHOD),
Herbert C. McKee, Ralph E. Childers, and Oscar Saenz, Jr. Jun 71, 27p* APTD-0904
Contract CPA-70-40
Errata sheet inserted.

Descriptors: (*Gas sampling, *Particles), (*Air pollution, Gas sampling), Tests, Statistical analysis, Variations, Errors, Laboratories, Calibrating.
Identifiers: *Air pollution detection.

Of all the various methods available to measure atmospheric particle contaminants, the so-called High Volume Method (frequently called 'Hi Vol' Method) has probably been used more extensively than any other. Since no standardized procedure has been available to guide different laboratories in the use of this method, each laboratory has had to develop and evaluate different techniques. The report presents the results of a collaborative test of the High Volume Method. A statistical analysis of the data obtained provided the following results: The relative standard deviation for single analyst variation; The relative standard deviation for multilaboratory variation is 3.7 percent; and the minimum detectable amount of particulate matter is 3 mg (95 percent confidence level). The method is rugged, and variations in procedure and technique can occur with only a minor effect on the results.

MEASUREMENT OF NON-METHANE HYDROCARBONS,
Oscar Saena, Jr., Clarence A. Boldt, Jr., and David S. Tarazi. Jun 71, 33p* APTD-0905
Contract CPA-70-40

Descriptors: (*Gas detectors, *Hydrocarbons), (*Air pollution, Hydrocarbons), Ionization gages, Methane, Gas sampling, Monitors, Calibrating, Air pollution, Activated carbon.
Identifiers: *Air pollution detection.

Because of recent air pollution laws, there is need of an accurate mobile hydrocarbon analyzer. Measurement of so-called 'non-methane hydrocarbons' was carried out in a mobile laboratory using a flame ionization detector. Total hydrocarbons were measured by running air directly through the detector. Methane was measured by running air through a methane-saturated carbon column which retained all organic contaminants other than methane. The difference was then the 'non-methane hydrocarbons.' Bag sampling may be superior to continuous monitoring, depending on circumstances. Sensitivity appears to be marginal in view of the federal standards. The method is subject to error due to difficulties in calibration, temperature control, and other variables. (Author)

COMPARISON OF AMBIENT AIR MEASUREMENT AND SOURCE MEASUREMENT,
Herbert C. McKee. Apr 71, 24p APTD-0902
Contract CPA-70-40

Descriptors: (*Air pollution, Standards), Monitors, Gas detectors, Gas analysis, Sources, Atmospheric composition.
Identifiers: *Air pollution standards, *Air pollution detection.

The report was prepared to aid in planning a program to standardize methods of source measurement used in air pollution control. Many differences exist between methods used for ambient air measurement and source measurement, related to the differences in concentration, temperature and humidity of the sample streams, interferences that affect analytical results, and other factors. The differences in the two types of methods have been substantial, therefore results obtained with these different methods likely are not equivalent. Emission standards have little meaning unless a method of measurement is specified, and specific methods or general guidelines have usually been published with such standards. The need for a standardization program is outlined.

A STUDY OF THE SOCIAL AND ECONOMIC IMPACT OF ODORS. PHASE II.
Final rept.

Nov 71, 313p* APTD-09899
Contract CPA-70-116
See also Phase 1, PB-194 376.

Descriptors: (*Odors, *Public opinion), (*Air pollution, Odors), Attitude surveys, Socioeconomic status, Urban areas, Economic analysis, Industrial wastes, Bias, Sources, Assessments, Bibliographies, Questionnaires, Food processing, Refineries, Sewage treatment, Chemical industry, California.
Identifiers: Los Angeles (California).

The results are presented of the second phase of research undertaken to establish air quality, performance and emission standards that specify what levels of odors are acceptable or how such levels should be determined. The ultimate objective of the research was the development of a method to assess the social and economic aspects of community odor problems. To accomplish this end the following tasks were undertaken: A metropolitan area was selected from a list of 31 potential odor problem areas; Public attitude surveys and technical field studies were conducted simultaneously; Comprehensive analysis of social and economic effects of odors was conducted, particularly as reflected in residential property values; A set of assessment procedures was prepared.

SULFUR REDUCTION OF ILLINOIS COALS — WASHABILITY STUDIES. PHASE II.
Final rept.,
R. J. Helfinstine, N. F. Shimp, J. A. Simon, and M. E. Hopkins. 28 Jul 71, 32p APTD-0841
Contract PH-86-67-206

Descriptors: (*Coal, Sulfur), (*Sulfur, Gravity separation), Coal preparation, Washing, Settlers (Separators), Removal, Grindability, Size separation, Size determination, Fractions, Illinois.
Identifiers: *Sulfur reduction, Illinois coals.

The report describes Phase II of an investigation to determine, by gravity separation technique, the extent to which the sulfur content of Illinois coals can be reduced and to study other washability characteristics. Twenty-seven mine samples were obtained, crushed to a top size of 3/8 inch, screened to 3/8 inch x 28 mesh, and separated into several specific gravity fractions which were subsequently analyzed. It was found that only 5 of the 27 samples came from mines that could produce coal with less than 1.5 percent total sulfur, and these 5 samples were from mines with relatively low sulfur content in the raw coal. CONTROL OF NITROGEN OXIDE EMISSIONS FROM DIESEL ENGINES: A THEORETICAL ANALYSIS,
E. K. Bastress, K. M. Chng, D. M. Dix, and R. J. Murad. 8 Jun 71, 106p* NREC-1160-1 APTD-0906
Contract EHS-70-116

Descriptors: (*Diesel engines, Exhaust gases), (*Air pollution, Nitrogen oxides), (*Exhaust gases, *Nitrogen oxides), Mathematical models, Design criteria, Combustion, Fuel injectors, Automobile engines.
Identifiers: *Diesel engine exhaust, *Air pollution control.

The report is concerned with the control of NOx emissions from diesel engines. The objective was to correlate engine design, performance, and emission characteristics by theoretical analysis, and to develop NOx-control criteria. Mathematical models of combustion and NO formation in diesel engines were developed; engine design, performance, and emission characteristics were correlated; and methods for controlling NO emissions were identified and evaluated. In direct-injection engines, NO emission rate is found to vary monotonically with fuel injection time, injection rate, and over-all fuel-air ratio. Qualitative guidelines have been defined for reducing NO emissions by manipulation of these design variables while minimizing the associated penalties in engine performance. The tendency for indirect-injection engines to produce lower NO emissions than direct-injection engines has been confirmed by the model. The direct-injection engine model has been used to evaluate turbo-charging, pilot injection, and fumigation as methods for reducing NO emissions. Of the approaches considered, only fumigation was found to decrease NO emissions.

RESEARCH AND DEVELOPMENT OF NEW POLYMER SYSTEMS FOR REVERSE OSMOSIS MEMBRANES.
Research and development progress rept.,
C. W. Saltonstall, Jr., and W. S. Higley. Oct 68, 71p OSW-PR-360
Contract DI-14-01-0001-1093

Descriptors: (*Desalting, Osmosis), (*Osmosis, *Membranes), Polycarbonate resins, Performance evaluation, Polymeric films, Flux (Rate), Acrylonitrile copolymers, Collagens, Cellulosic resins, Ethyl cellulose, Polyacrylamides, Mechanical properties, Fabrication, Casting, Polymerization.
Identifiers: *Reverse osmosis desalination.

The object of the research was to develope new reverse osmosis membranes superior to cellulose acetate. Poly (vinylene carbonate) which was polymerized from the purified monomer as required was evaluated in the form of thin or ultrathin films. Knife-cast films showed increasing flux and decreasing salt retention with time and eventual loss of useful osmotic properties. Copolymers of vinylene carbonate were prepared and evaluated. Attempts to prepare a copolymer from vinylene carbonate and N-vinyl-2-pyrrolidone comonomers in bulk were not successful. Acetone soluble nitrile polymers and copolymers prepared from methacrylonitrile were also investigated as were films of a microcrystalline form

of collagen. The incorporation of 10% poly (diacetone acrylamide) into ethyl cellulose resulted in films with salt retentions of 98.3 to 99.5%.

TOLEDO AIR POLLUTANT EMISSION INVENTORY,
David V. Mason. Jul 69, 59p* APTD-0888

Descriptors: (*Air pollution, *Ohio), (*Michigan, Air pollution), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Toledo (Ohio), Monroe County (Michigan), Lucas County (Ohio), Wood County (Ohio), Ottawa County (Ohio), Sandusky County (Ohio).

The report presents the emission inventory of the Toledo, Ohio metropolitan area. Emissions of five pollutants (SO (x), Particulates, CO, Hydrocarbons, and NO (x)) are estimated for 1967. Summaries of the estimates are tabulated for each pollutant by subcategories within four source categories: transportation, combustion of fuels by stationary sources; refuse disposal; and industrial process emissions. Detailed estimates by category, and by a grid coordinate system are presented. For each pollutant five densities of emission are plotted on a grid of the area.

Identifiers: *Computer mapping techniques, Computer graphics, SYMAP computer program, Coal (High sulfur), Coal (Low sulfur), Appalachian region.

The aim was to display the quantity of coal available at various sulfur levels. The study areas were in the Appalachian Coal Region and, in particular, in a two county area in Maryland. Values for sulfur content, bed thickness, and quantity of coal were manipulated and mapped using several computer mapping programs. The problem definition, computer program used, study area selection and data acquisition, and the graphic techniques used are covered. The study areas and data used, and the computer maps produced are discussed in some detail. The step by step description of the mapping procedures used for the study areas, the references, and the technical aspects of program development are presented.

Identifiers: *Verticle tube evaporation, Water pollution control.

The technical feasibility of evaporation of municipal sewage treatment plant effluent for the purpose of water reuse was investigated. The equipment used was a long tube vertical (LTV) evaporator. The objectives of the research were to determine the effects of feedwater quality, and evaporation conditions on product water quality, post evaporation polishing, and evaporator tube scaling. The experimental equipment consisted of a three-effect evaporator constructed of 316 stainless steel. Feedwaters tested in the evaporator included extended aeration effluent, high rate trickling filter effluent, and contact stabilization effluent. The scaling evaluations were carried out under pressure conditions using extended aeration and trickling filter effluent. Because of increased efficiencies, wastewater evaporation should be more economical than sea water evaporation. (Author)

Descriptors: (*Water pollution, *Research management), Computer programming, Contract administration, Research products, Benefit cost analysis, Management planning, Water quality, Industrial waste treatment, Sewage treatment.

A computerizable analysis system for determining maximum benefit per increment of capital expenditure has been developed to aid the Environmental Protection Agency in selecting those research projects which will provide the greatest amount of water pollution abatement per dollar expended. Five main subsets with a total of 24 information sources are used to provide input, with the variables listed in terms of relative rankings rather than absolute values. The subsets are: (1) Effluent constituents; (2) Industrial groups; (3) State dimensions; (4) Project descriptions; and (5) General statistics. The system has been developed for implementation on the basis of aggregation of data on a state-by-state basis, but the geographical base may be readily expanded to include river basins, or contracted to run on a county by county basis. The system accounts for both past and current fundings of projects, allows policy decisions on the part of EPA management to be superimposed at several levels, and permits analysis of the effects of various policy decisions.

Paper copy available from GPO $1.75 as I67.13/4:12020FPD09/1.

Descriptors: (*Water pollution, *Phosphates), (*Industrial waste treatment, Phosphates), (*Fertilizers, Water pollution), (*Nitrogen inorganic compounds, Water pollution), Industrial wastes, Mining, Surveys, Industrial water, Beneficiation, Economic analysis, Cost estimates, Processing, Phosphoric acid, Chemical engineering, Ammonia, Ammonium compounds, Nitrates, Nutrients.

Identifiers: *Phosphate mining, Water pollution control, Phosphate slimes.

A state-of-the-art survey was made of the water pollution problems which result from the production of inorganic fertilizers and phosphate rock. Information required to complete the study was obtained through an extensive literature search, questionnaires sent to the major fertilizer producers, and visits to selected production plants. Ninety eight plants representing thirty three different companies were surveyed. Production figures since 1940 and estimates of production through 1980 were accumulated for phosphate rock and the major fertilizer products. The specific production operations which are the principal generators of contaminated waste waters were identifed, and the waste water volumes and compositions for each operation were determined wherever possible. The capability of current technology to treat and control the contaminated waste waters generated by the fertilizer industry was evaluated. Problem areas where additional research and development effort is needed to provide adequate control of waste water discharge were identified.

Contract FWPCA-WP-01530
Paper copy available from GPO $0.50 as EP2.10:18050DOH06/71.

Descriptors: (*Water pollution, Mine waters), (*Fishes, Water pollution), (*Toxicology, *Mine waters), (*Manganese inorganic compounds, Water pollution), Turbidity, Virginia, Strip mining, Bioassay, Spoil, Surface water runoff, Land reclamation.
Identifiers: *Water pollution effects (Animals), *Manganese mining.

The results of the investigation suggest a number of conditions to be met for effective reclamation particularly of manganese strip mines, and in general any surface mining which tends to increase the degree of siltation and turbidity in receiving waters. Seasonal monitoring of certain chemical, physical, and biological parameters of streams draining manganese strip mine spoils in three stages of reclamation verified that the community structure of fish and benthic macroinvertebrates in these streams remains severely depressed until complete reclamation of the spoils has been accomplished. Laboratory studies established the median tolerance limits of three native species of fishes to silt in suspension and to manganese ions. These studies suggest that the principal factor depressing the faunal communities in partially reclaimed and unreclaimed streams is the chronically high degree of turbidity and siltration.

OXYGEN REGENERATION OF POLLUTED RIVERS. THE PASSAIC RIVER.

Mar 71, 65p W72-03780, EPA-WQO-16080-FYA-03/71
Paper copy available from GPO $0.65 as EP2.10:16080FYA03/71.

Descriptors: (*Water pollution, Aeration), (*Stream pollution, *Aeration), Field tests, Oxygen, Dissolved gases, Water quality, Biochemical oxygen demand, Mathematical models, Barriers, Aerators, Diffusion.
Identifiers: Passaic River.

Field tests were made of a mechanical surface aerator and of pure oxygen diffusers in a small polluted river, the upper Passaic, New Jersey. Their purpose to raise the dissolved oxygen level in polluted waters. Results generally corroborated results of previous test, as to performance of surface aerators on such rivers, in excavated pools. A somewhat higher oxygen transfer rate was obtained with a flow concentration device, which, in a permanent installation, would take the form of low rock spur dikes, one extending from each bank, or flow concentration groins. Tests of oxygen diffusers were fragmentary. A dye dispersion test gave a very high longitudinal dispersion coefficient downstream of the aerator. Mathematical modelling indicated that during the period of test, parameters of biochemical deoxygenation were not changed by the artificial aeration process. (See also W72-03779)

DEMINERALIZATION OF WASTEWATER BY THE TRANSPORT-DEPLETION PROCESS,
Robert E. Lacey, and Everett L. Huffman. Feb 71, 65p W72-03782, EPA-WQO-17040-EUN-02/71
Contracts FWQA-14-12-443, FWQA-14-12-812
Paper copy available from GPO $0.65 as I67.13/4:17040EUN02/1.

Descriptors: (*Sewage treatment, *Electrodialysis), (*Chemical removal (Sewage treatment), Electrodialysis), (*Demineralizing, Sewage treatment), Membranes, Demineralization, Fouling, Ion exchange resins, Flushing, Cost estimates, Feed water treatment, Performance evaluation, Regenerated cellulose.
Identifiers: Transport depletion process.

The transport-depletion process was investigated for demineralizing clarified or filtered municipal secondary effluent. Regenerated-cellulose membranes were not effective. The major problems encountered in demineralization of wastewaters by conventional electrodialysis, fouling and scaling, were, however, largely overcome by the use of a special anion-selective membrane and periodic flushing of the stack with sodium chloride solution. Membrane fouling was largely overcome by flushing the stack with a sodium chloride solution. Cost estimates are given.

CONTROL OF POLLUTION FROM OUTBOARD ENGINE EXHAUST. A RECONNAISSANCE STUDY.

Sep 71, 42p W72-03783, EPA-WQO-15020-ENN-09/71
Paper copy available from GPO $0.50 as 167.13/4:15020ENN09/71.

Descriptors: (*Water pollution, Oils), (*Outboard engines, Water pollution), (*Marine engines, Water pollution), Biodeterioration, Recreation, Gasoline, Aquatic microbiology, Solubility, Tests, Two stroke cycle engines, Exhaust emissions.
Identifiers: *Oil pollution, *Water pollution control equipment, Oil pollution control.

A reconnaissance study has been made to determine the extent of pollution which results from the operation of a two-cycle outboard engine. Comparisons have been made of engine operation with and without a pollution control device attached. Studies have also been made of the biodegradability of the fuel and exhaust products. Tests made in a swimming tank with an untuned engine have shown that the quantity of fuel wasted as exhaust varied from about 7 percent of the volume of fuel used at high speeds, to over 30 percent at low speeds. When the Goggi pollution control device was installed, these quantities were intercepted and collected rather than discharged with the exhaust. Analysis at various depths indicated that nearly all products separated from the water in a short time and collected on the surface. Various analytical techniques were studied. Both fuel and exhaust products are capable of supporting microbial growth. (EPA abstract)

Identifiers: Coal mine spoils, *Water pollution control, *Mine acid drainage, Mine wastes.

A project has been underway which attempts to demonstrate practical means of abating pollution from coal mine mineral wastes. The site included a refuse pile occupying approximately 40 acres and a slurry lagoon complex of 50 acres. In the report, the characteristics and acid formation rate of the refuse pile are described. The average rate of acid formation for this refuse pile is 198 pounds of acidity, as CaCO3, per acre per day. Acid contribution from the slurry lagoons was not determined but appears to be negligible. As an abatement measure, a number of experimental vegetative covers were tested. Grass was successfully

established with and without the use of topsoil, weathering well for one year. The long-term effects of establishing a grass cover directly on the refuse without the use of topsoil are not known at this time. (Author)

Descriptors: (*Aeration, *Stream pollution), (*Lakes, Aeration), Air entrainment, Oxygenation, Cost estimates, Oxygen, Circulation, Water quality, Mixing, Dissolved gases, Aerators, Hydraulic engineering, Nutrients.
Identifiers: Eutrophication, Water pollution control.

The report is concerned with economical methods for maintaining high levels of dissolved oxygen in quiet rivers and ponds. The object being to control eutrophication of bodies of water with a high nutrient content. The annual cost of adding oxygen to streams and lakes is estimated for a variety of existing and new aerating devices. Analytical and empirical equations are presented for the determination of operating characteristics of the various devices used to aerate natural bodies of water. The most economical means of artificial aeration generally possible for streams was found to be mechanical aerators which generate a highly turbulent white-water surface. For a lake, the most economical technique for the continual input of oxygen into a lake was found to be diffused aeration using air bubbles. The most economical technique for rapid input of oxygen, operating only while the lake is being destratified, was found to be a hybrid system which draws water from the lake bottom and discharges it at the surface where it is aerated by a mechanical aerator. POLLUTION ABATEMENT BY FIBER MODIFICATION.
Water pollution control research series.
Jan 71, 63p W72-03982, EPA-WQO-12040-EFC-01/71
Paper copy available from GPO $0.65 as EP2.10:12040EFC01/71.

Descriptors: (*Spent liquors (Pulping), *Industrial waste treatment), (*Water pollution, Spent liquors (Pulping)), (*Triazines, Dyeing), (*Wood fibers, Dyeing), Utilization, pH, Wood fibers, Lignocellulose, Polymerization, Chlorine organic compounds, Amination, Spent sulfite liquors, Sulfonates.
Identifiers: *Lignosulfonates, *Water pollution control, Triazine/dichloro.

The research goal undertaken was to develop systems capable of abating the pollution resulting from the discharge of lignosulfonates or bleach plant effluent by finding a suitable use for these pollutants. It was desired to devise procedures for the attachment of lignosulfonates or other lignin-derived pollutants to wood or pulp fibers to create useful fiber-polymer composites. The plan was predicated upon the then unrecognized potential of fiber reactive dye chemistry as a general foundation for fiber modification. The report describes research to determine whether the chemistry developed for dyeing cotton was applicable to wood derived fibers of differing morphology and chemical composition. A typical dichloro-s-triazine fiber reactive dye was selected because of its availability and because after reaction it would still be expected to contain one reactive chlorine suitable for the attachment of pollutants. The dye was found to react with a wood-derived fibers suitable for the subsequent attachment of lignosulfonates or bleach plant effluents. The effects of various reaction conditions including pH and time, were investigated and are reported.

MICROBIOLOGICAL TREATMENT OF ACID MINE DRAINAGE WATERS.
Water pollution control research series.
Sep 71, 85p W72-04100, EPA-WQO-14010-ENW-09/71
Paper copy available from GPO $1.00 as EP2.10:14010 ENW 09/71.

Descriptors: (*Mine waters, *Biodeterioration), (*Ferrobacillus, Mine waters), (*Thiobacillus, Mine waters), Aeration, Iron, Neutralizing, Limestone, Oxidation, Hydrogen sulfide, Desulfovibrio, Phosphates.
Identifiers: *Mine acid drainage.

The purpose of the study was to determine if the abilities of certain bacteria to oxidize ferrous iron or to convert sulfate to hydrogen sulfide could be applied to the neutralization and subsequent removal of iron from difficult-to-treat mine drainage waters. If one or both of these concepts could be successfully utilized, the expense of adequately treating these types of problem waters might be significantly reduced. Laboratory studies demonstrated that both pure cultures and fresh field cultures of acidophilic iron bacteria could readily oxidize ferrous iron in both synthetic and natural acid mine drainage waters. Approximate requirements of oxygen, carbon dioxide, nitrogen and phosphorus by the iron bacteria were established. Limestone neutralizations of partially oxidized acid mine waters were conducted. Although sulfate-reducing bacteria were isolated, attempts to grow the cultures or produce hydrogen sulfide at pH values below 5.5 were unsuccessful.

FEASIBILITY STUDY UPPER MEANDER CREEK. MINE DRAINAGE ABATEMENT PROJECT.
Water pollution control research series.
Sep 71, 54p W72-04101, EPA-WQO-14010-HBQ-09/71
Contract DI-68-01-0063
Paper copy available from GPO $0.60 as EP2.10:14010HBQ09/71.

Descriptors: (*Water pollution, *Mine waters), (*Land reclamation, *Strip mining), Surface drainage, Cost estimates, Erosion control, Feasibility, Esthetics, Water quality, Vegetation.
Identifiers: *Water pollution control, *Mine acid drainage.

The Upper Meander Creek Site in Mahoning County, Ohio, has been extensively surface mined for coal. Revegetation of the spoil area has met with only limited success, leaving the majority of the site generally devoid of tree and grass cover and subject to rapid runoff and severe erosion. A mine drainage abatement demonstration project is recommended for the area to demonstrate effective techniques for mine drainage abatement and beneficial utilization of a mined area, and also to solve a specific mine drainage problem. The report is a presentation of an evaluation of the feasibility of such a mine drainage control demonstration project.

CONTROLLING FACTORS IN METHANE FERMENTATION.
Final rept. 1 Sep 68-31 Aug 69,
R. E. Speece, and Ralph Clark. Sep 69, 252p
NMSU-EES-61-70 W72-04097, EPA-WQO-17070-06/69
Grant FWPCA-WP-01001

Descriptors: (*Sewage treatment, Fermentation), (*Fermentation, *pH control), (*Anaerobic bacteria, Sewage treatment), Anaerobic processes, Spirillaceae, Reaction kinetics, Acetates, Reviews.
Identifiers: *Methanobacterium.

Conventional wastewater treatment plants generally use an anaerobic digester to stabilize the wastewater settleable solids and the excess microbial solids produced within the plant. The anaerobic fermentation process is very pH dependent. The methane bacteria which are responsible for the final step in the anaerobic fermentation process and are probably responsible for most operational problems as they are considered to be very pH sensitive. Because of this sensitivity, the pH tolerance of the acetate fermenting methane bacteria was investigated using laboratory anaerobic filters. The research involved the following studies: determining what relative rate of methane production can be achieved at various pH levels, determining the effect of the non-optimum pH duration on the fermentation rate, and determining what fermentation recovery time can be expected from non-optimum pH levels and what effect the non-optimum pH duration has on this recovery.

FLOCCULATION AND CLARIFICATION OF MINERAL SUSPENSIONS.
Water Pollution Control Research series.
May 71, 126p W72-04098, EPA-WQO-14010-DRB-05/71

Descriptors: (*Suspended sediments, *Clarification), (*Industrial waste treatment, *Flocculating), Flocculants, Starches, Calcium, Quartz, Iron hydroxides, Polymers, Performance evaluation, Zeta potential, Benefication, Viscosity, pH control, Water pollution, Polyacrylamides.
Identifiers: *Water pollution control, Goethite.

The clarification of plant effluents, particularly those from mineral processing operations, is

becoming of much concern for the prevention of stream and lake pollution. The present study was undertaken in order to examine the mechanism of a combined use of a multivalent cation and a polymeric compound, to arrive at a most effective choice in their use as flocculants for the control of water pollution problems, and to establish the effect of size distribution on floc formation and clarification. For prototype solids, quartz and goethite of several different size distributions were chosen. At the same time they constitute the main components of the ore minerals of immediate interest for the iron ore industry of Minnesota. For flocculants, calcium ion and unmodified corn starch were used mainly because their use is well established. The investigation was later extended to include chemically modified starches and polyelectrolytes.

DAYTON AIR POLLUTANT EMISSION INVENTORY,
Alan J. Hoffman, and Clyde B. Morita. Nov 68, 51p APTD-0876

Descriptors: (*Air pollution, *Ohio), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Dayton (Ohio), Drake County (Ohio), Miami County (Ohio), Preble County (Ohio), Montgomery County (Ohio).

The report is a compilation of air pollutant emissions in the Dayton, Ohio Metropolitan Area. The objectives of this emission inventory were to determine the quantity of the various air pollutants emitted as well as delineate their geographical and seasonal variations. This was done by using a modified form of the Rapid Survey Technique. The study area was divided into a grid coordinate system, and the emission quantities were reported in terms of tons of pollutants per grid for a summer, winter, and average day. The pollutants considered in this survey were sulfur oxides, particulates, carbon monoxide, hydrocarbons, and oxides of nitrogen.

Descriptors: (*Air pollution, *New York), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Buffalo (New York), Erie County (New York), Niagara County (New York).

The results of an emission inventory of air pollutant sources in the Buffalo, New York Metropolitan Area is presented. The objectives of the study were to determine the total quantities of the various air pollutants emitted and to estimate their seasonal and geographical variation. The study area was divided into a grid coordinate system, and the emission quantities were reported in terms of tons of pollutant per grid for a summer, winter, and average day. The pollutants considered in this survey were sulfur oxides, particulates, carbon monoxide, hydrocarbons, and nitrogen oxides. The source categories considered were fuel combustion in stationery sources, transportation, industrial processes, and solid waste disposal.

Prepared in cooperation with Rice (Cyrus Wm.) and Co., Pittsburgh, Pa.
Paper copy available from GPO $1.75 as EP2.10:12020EJI07/71.

Descriptors: (*Industrial waste treatment, *Chemical industry), (*Water pollution, *Industrial wastes), Inorganic chemistry, Cost estimates, Capital costs, Operating costs, Forecasting, Chemical engineering, Injection wells, Sewage treatment, Neutralizing, Chlorine, Pigments, Fertilizers, Insecticides, Explosives, Lagoons (Ponds), Clarification.
Identifiers: *Water pollution control.

The report presents a description of the inorganic chemical industry and the costs that the industry would incur in attaining various levels of pollution abatement over the five-year period through 1974. For the study purposes, the inorganic chemical industry has been defined as including establishments producing alkalies and chlorine, industrial gases, inorganic pigments, paints and allied products, fertilizers (excluding ammonia and urea), inorganic insecticides and herbicides, explosives, and other major industrial inorganic chemicals. The report presents in considerable detail the description of the various production processes, the waste treatment methods practiced, and the possible impact that changes in processes might have on the volume and character of the wastes produced. A COMPILATION OF COST INFORMATION FOR CONVENTIONAL AND ADVANCED WASTEWATER TREATMENT PLANTS AND PROCESSES.
Robert Smith. Dec 67, 55p W72-04298, EPA-17090-12/67

Descriptors: (*Sewage treatment, Cost estimates), Activated sludge process, Sewage filtration, Trickling filtration, Sedimentation, Stripping (Distillation), Activated carbon treatment, Electrodialysis, Aeration, Chlorination, Sewer pipes, Capital costs, Design criteria, Operating costs.
Identifiers: Sewage treatment plants, Secondary sewage treatment.

The cost associated with building and operating wastewater treatment plants or individual wastewater processes has always been difficult to estimate for planning purposes. It is hoped that this will prove a useful working document for engineers and scientists working in the field of wastewater treatment. Costs for conventional treatment plants include those for primary sedimentation, activated sludge and trickling filter plants. Advanced treatment processes considered in this collection are: solids removal by coagulation and sedimentation; filtration through sand or graded media; ammonia stripping, granular carbon adsorption; electrodialysis, microstraining of secondary effluent; aeration of secondary effluent; chlorination of secondary effluent; and pipelines for ultimate disposal. Also, added are construction costs for individual equipment, structures and consumable items.

ONONDAGA LAKE STUDY.
Water pollution control research series.

Apr 71, 485p W72-04277, EPA-11060-FAE-04/71
Paper copy available from GPO $4.50 as stock no. 5501-0099.

Descriptors: (*Water pollution, *Lakes), Water quality, Sewage, Limnology, Temperature, Water chemistry, Chlorides, Calcium, Aquatic biology, Fishes, Plankton, Stratification, Benthos, Monitors, Trace elements, New York.
Identifiers: *Onodaga Lake, Eutrophication.

The study was conducted to appraise the trophic status of the saline Onondaga Lake, Onondaga County, New York, and to estimate the effects of the proposed waste treatment plant. The determined parameters included circulation patterns, distribution of chemical constituents, and the biotic contents of the lake. Mineral-water equilibria showed an uninterrupted and a widely distributed formation of phosphate-bearing minerals. The predominant component of lake sediments is calcium. The salinity of lake water did not preclude occurrence of a wide variety of phytoplankton, zooplankton, and fish. Proposed waste treatments should significantly increase the supply of dissolved oxygen and lower the phosphorus concentration.

WATER QUALITY CONTROL THROUGH FLOW AUGMENTATION.
Water pollution control research series,
David B. Baker, and Jack W. Kramer. Jan 71, 162p W72-04260, EPA-WQO-16080-DFO-01/71
Paper copy available from GPO $1.50 as EP2.10:16080DFO01/71.

Descriptors: (*Water quality, *Stream flow), (*Water pollution, Stream flow), Limnology, Fluorides, Calcium, Magnesium, Sodium, Phosphorus inorganic compounds, Nitrates, Dissolved gases, Oxygen, Algae, Ohio.
Identifiers: Sandusky River.

A 60-mile section of the Sandusky River, Ohio, was investigated to evaluate the relationship between the volume and the quality of flowing water. The content of fluoride, calcium, magnesium, and sodium were directly and those of total and soluble phosphorus indirectly related to the flow volume. No correlation was observed between the flow and concentration of either potassium or nitrates. Oxygen content was high at an abundant flow, but showed considerable variation, being influenced by respiration of algae. The study suggested that an increased current velocity reduces the density of algal population. (Author)

SOLID WASTES MANAGEMENT IN GERMANY. REPORT OF THE U.S. SOLID WASTES STUDY TEAM VISIT. 25 JUNE-8 JULY 1967,
Samuel A. Hart. 1968, 26p EPA-SW-2-68
Library of Congress Catalog Card no. 68-62432.

Descriptors: (*Refuse disposal, *West Germany), Evaluation, Comparison, Earthfills, Composts, Incinerators, Economic analysis.
Identifiers: *Solid waste disposal, Sanitary landfills.

In 1967, a nine-member team of scientists and engineers sponsored by the federal solid wastes program investigated domestic refuse management practices in Germany. The trip was designed to evaluate the possibilities of applying German technology to U.S. needs and to encourage mutual information exchange between the two countries. The common disposal methods--landfilling, composting, and incineration--were observed and compared to similar operations in the United States. Economic, political, and philosophic differences between the two countries were shown in the dissimilar characteristics of the solid wastes and in the emphasis placed on certain management practices. EVALUATION OF SELECTED EARTHMOVING EQUIPMENT FOR THE RESTORATION OF OIL-CONTAMINATED BEACHES.
Water pollution control research series, 29 Aug 69-1 Jul 70.

Oct 70, 174p W72-04296, EPA-15080-EOS-10/70
Paper copy available from GPO $1.50 as EP2.10:15080EOS10/70-1.

Descriptors: (*Water pollution, Oils), (*Beaches, *Cleaning), (*Earth handling equipment, Cleaning), Field tests, Performance evaluation, Operating costs, Cost estimates, Straw, Scrapers, Graders, Front end loaders, Conveyors.
Identifiers: *Oil pollution removal, Oil pollution.

Field studies of earthmoving equipment units were conducted to evaluate their use and effectiveness in restoring oil contaminated beaches. Specifically, operating procedures and cost estimates were desired, along with any useful design modifications. Previous beach restoration operations were reviewed prior to initiation of the field tests for information about the type of performance required. The field tests were then performed on each equipment/procedure unit to determine efficiency, flexibility, and performance characteristics under a variety of field conditions. Oil removal effectiveness was greater than 98% for all restoration procedures, with the highest effectiveness being achieved by a motorized grader and a motorized elevating scraper working in combination. Conveyor screening systems can be effectively utilized. Costs for removal are reported. (Author)

THE SOCIAL IMPACT OF NOISE.

31 Dec 71, 25p* EPA-NTID300.11

Descriptors: (*Noise, *Sociology), (*Public health, Noise), Urban areas, Transportation, Construction, Communities, Adaptation, Stress (Physiology), Stress (Psychology), Industrial hygiene.
Identifiers: *Noise pollution.

The World Health Organization defines health as a state of physical, mental, and social well being and not merely the absence of disease or infirmity. Using this definition it is evident that noise can be considered as having an important influence on the health of man. Because of its pervasive influence in all settings, activities and walks of life it has been often cited as a major source of annoyance as well as a threat to physical and mental health. For most people the usual consequences of noise are associated with interference with listening to speech or other sounds, distraction at home and on the job, disturbance of rest and sleep, and disruption of recreational pursuits. All of the foregoing can be considered components of the quality of life. In dealing with the social impact of noise, this report is divided into several sections: Overview; Extent of problem -- changing scope of problem; Effects of noise -- medical, psychological, social.

REMOTE SENSING OF POLLUTANTS.
Annual rept.,
R. L. Schwiesow. 30 Jun 71, 53p APTD-0891

Descriptors: (*Air pollution, *Infrared spectroscopy), Carbon monoxide, Sulfur dioxide, Hydrogen chloride, Ozone, Nitric acid, Ammonia, Data processing, Computer programs, Remote sensing, Fluorescence, Infrared spectra, Optical radar, Light scattering.
Identifiers: *Air pollution detection.

Research results obtained during FY 71 are summarized on quantitative infrared spectra of pollutant gases such as CO, O3, HCl, SO2, NH3, and HNO3; on analyzing long path infrared spectra by digital means for atmospheric gas concentrations; on scattering cross section measurements for SO2 and NO; and on literature search and consultative services in atmospheric spectroscopy. Explanations and reviews of the particular results are illustrated by samples of the voluminous transmission tables and graphs supplied separately. The developed information is crucial for proper interpretation of remote sensing field measurements of pollutant concentrations in both source and ambient situations. (Author)

DENVER AIR POLLUTANT EMISSION INVENTORY,
Clyde Morita, Guntis Ozolins, and George Duggan. Aug 68, 44p APTD-0880

Descriptors: (*Air pollution, *Colorado), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Evaporation, Waste disposal, Demography, Transportation, Industrial wastes.
Identifiers: *Air quality data, *Denver (Colorado), Adams County (Colorado), Arapaho County (Colorado), Boulder County (Colorado), Denver County (Colorado), Jefferson County (Colorado), Larimer County (Colorado), Weld County (Colorado).

A rapid emission inventory of air pollutant sources in the Denver metropolitan area is reported. The objectives were to determine the total quantities of various air pollutants emitted and to estimate their geographical and seasonal variation. The study area was divided into a grid coordinate system and the emission quantities were reported in terms of tons of pollutant per grid on an average annual day, average summer day, and average winter day. Sulfur oxides, particulates, and carbon monoxide were included. (Author)

OIL SPILL CONTAINMENT SYSTEMS.
Oct 70, 140p* W72-04826, FWQA-15080-10/70

Descriptors: (*Water pollution, Oils), (*Booms (Equipment), Water pollution), Reviews, Barriers, Cost estimates, Design criteria.
Identifiers: Oil pollution, *Oil pollution containment, *Oil retention booms.

A wide variety of devices have been designed to prevent the spread of oil slicks over wide areas. An attempt was made to include a description of all of the various types of barriers currently in the published literature, under patent application, in the final stages of development, and those available as full scale commercial equipment today. Performance data, when documented by reliable and competent personnel, are also included. The containment systems listed may be broadly generalized into the following types: commercial floating booms, improvised booms, and air barriers. More than 50 approaches to the problem are encompassed in the report, although many more systems are possible. (Author)

Paper copy available from GPO $4.50 as stock no. 5501-0129 EP2.10:16070DZV02/71.

Descriptors: (*Estuaries, Mathematical models), (*Water pollution, Estuaries), Reviews, Hydraulic models, Water quality, Temperature gradients, Aquatic biology, Hydrodynamics, Water chemistry, Mixing, Tidal currents, Water flow, Limnology.
Identifiers: Thames River, Delaware River, San Francisco Bay, Galveston Bay.

A technical review and critical appraisal are presented of present techniques of water quality modeling as applied to estuaries. Various aspects of estuarine modeling are treated by a selection of scientists and engineers eminent in the field, and these essays are supplemented by discussions from technical conferences held during the course of the report's preparation. Topics discussed include mathematical models for estuarine hydrodynamics, water quality models of chemical and biological constituents, models of estuarine temperature structure, and the use of physical models in estuarine analysis. Also included is a review of solution techniques, viz. analog, digital and hybrid, a brief survey of estuarine biota and biological modeling, and a collection of case studies reviewing several estuarine modeling projects. WATER POLLUTION POTENTIAL OF SPENT OIL SHALE RESIDUES.
Water pollution control series.

Dec 71, 119p W72-04556, EPA-14030-EDB-12/71
Paper copy available from GPO $1.25 as EP2.10:14030EDB12/71.

Descriptors: (*Oil shale, Soil erosion), (*Soil erosion, Water pollution), (*Tailings, *Surface water runoff), Water erosion, Rain, Leaching, Sulfates, Sodium sulfates, Computer programming.

Physical properties, including porosity, permeability, particle size distribution, and density of spent shale from three different retorting operations, have been determined. Slurry experiments were conducted on each of the spent shales and the slurry analyzed for leachable dissolved solids. The concentrations of the various ionic species in the initial leachate from the column were high. The major constituents, SO4 (-2) and Na (+), were present in concentrations of 90,000 and 35,000 mg/l in the initial leachate; however the succeeding concentrations dropped markedly during the course of the experiment. A computer program was utilized to predict equilibrium concentrations in the leachate from the column. The extent of leaching and erosion of spent shale, and the composition and concentration of natural drainage from spent shale has been determined using oil shale residue and simulated rainfall. Concentrations in the runoff from spent shale have been correlated with runoff from the spent shale have been correlated with runoff rate, precipitation intensity, flow depth, application time, slope, and water temperature. Identifiers: *Eutrophication, Chlorella pyrenoidosa.

The kinetics and characteristics of phosphate-limited algal cultures were studied on a laboratory scale in order to: Evaluate kinetic parameters of algal growth in relation to phosphorus concentration; Derive an expression describing the growth rate-limiting nutrient relationship; and Determine desirable or optimum design and operating parameters for effective phosphorus removal by algal systems. Phosphorus limiting algal growth was described by the Monod growth model for specific growth rate. Maximum specific growth rate for the algae tested was 4.19/day, and all growth characteristics were significantly affected by variations in pH and temperature of the culture. Removals of moderate concentrations of phosphorus in excess of 85% can be accomplished by continuous algal cultures. (Author)

Descriptors: (*Algae, *Sewage treatment), (*Nitrogen inorganic compounds, Chemical removal (Sewage treatment)), (*Nutrients, *Chemical removal (Sewage treatment)), Phosphorus inorganic compounds, Nitrogen inorganic compounds, Plant growth, Ammonia, Process variables, Design criteria, pH control, Temperature control, Computer programs, Industrial plants.
Identifiers: Potamocypris.

Four small outdoor reactors, a predator infested outdoor pond, and numerous indoor systems were designed, constructed and operated to provide data describing the kinetics aspects of algal systems used as wastewater treatment schemes. The studies included determinations of: The kinetics of ammonia-nitrogen as a growth limiting factor; The effect of nutrients in wastewater effluents on algal growth; Suggested designs for both indoor and outdoor growth reactors; and Predator-prey relationships in outdoor algal systems. Specific growth rate data for nitrogen were quite consistent, allowing the use of the maximum specific net growth rate as an extremely reliable parameter of system operation. Other studies demonstrated that permissible dilution ratios for waste water discharges into receiving waters can be formulated empirically. Design and operational information of various systems is presented, as well as preliminary bioassay results on the microbial populations of algal ponds. (Author)

Descriptors: (*Algae, *Sewage treatment), (*Nutrients, *Chemical removal (Sewage treatment)), (*Lagoons (Ponds), Sewage treatment), Limnology, Phosphorus inorganic compounds, Nitrogen inorganic compounds, Design criteria, Anaerobic processes, Process variables, pH control, Biochemical oxygen demand, Plant growth, Design criteria.

Three domestic sewage stabilization pond systems were studied to evaluate the relationship between design criteria and performance criteria for pond systems in accomplishing specific waste treatment steps. One system consisted of a lined high-rate pond following sedimentation, another was comprised of conventional secondary waste treatment followed by a pond system, and the last consisted solely of several deep ponds in series. Study results indicated that the last system, consisting of an anaerobic pond, an unlined high rate pond, and deep high-rate polishing pond, was effective in both BOD and nutrient removals, with mean annual removals of 97.3%, 93.2%, 91.6%, and 64.5% for BOD, COD, total nitrogen, and phosphate. Results confirmed that pond functioning is determined by position with respect to other ponds and unit processes, as well as their individual design characteristics. (Author)

GUIDELINES: BIOLOGICAL SURVEYS AT PROPOSED HEAT DISCHARGE SITES,
Ronald R. Garton, and Ralph D. Harkins. Apr 70, 111p W72-04828, EPA-WQO-16130-04/70
Prepared in cooperation with Robert S. Kerr Water Research Center, Ada, Oklahoma.
Paper copy available from GPO$1.00 as EP2.10:16130-04/70.

Descriptors: (*Water pollution, Heat), (*Aquatic biology, Heat), (*Limnology, Heat), Fishes, Zooplankton, Phytoplankton, Ecology, Statistical analysis, Sampling, Electric power plants.
Identifiers: *Water pollution effects (Animals), *Thermal pollution.

A quantitative approach is presented for the biological portion of thermal discharge siting surveys and discharge monitoring. Three types of studies are covered: A very general study of the aquatic system and the pertinent literature; A comprehensive pre-operational study designed to supply data for management decisions on power plant siting and data to serve as baseline for possible future comparison; and A post-operational continuation to detect possible effects if a thermal discharge to a natural water body is allowed. Two methods are recommended for location of sampling stations by use of a grid system based on planned outfall design. Sample collection and handling methods and frequency of sampling are suggested for fish, macroinvertebrates, plankton, periphyton and aquatic macrophytes. Methods of data handling recommended include diversity and redundancy indices and a combination of the two into one value for a test for dispersion. A scale of importance is suggested for organisms of special value in either an economic or ecologic sense. (Author)

May 70, 179p W72-04831, EPA-16130-DFX-05/70
Contract EPA-14-12-521
Paper copy available from GPO $1.50 as EP2.10:16130DFX05/70.

Descriptors: (*Lagoons (Ponds), *Cooling water), (*Economic analysis, Cooling water), (*Electric power plants, Lagoons (Ponds)), Heat, Temperature control, Capital costs, Heat transfer, Performance evaluation, Design criteria, Evaporative cooling, Heat budget, Water pollution.
Identifiers: *Cooling ponds, *Thermal pollution.

A procedure for predicting the temperature of a thermally loaded captive pond is presented. Using this information, the cooling pond is shown in a special case to have an economic advantage over a cooling tower and to be not much more expensive than a natural body (stream or ocean) of water. This, with the ecological and recreational assets of a captive cooling pond, would seem to encourage their expanded use with large thermo-electric power plants. (Author)

Contract PH-86-68-66

Descriptors: (*Air pollution, *Particles), (*Smoke, Measurement), United States, Great Britain, Gravimeters, Optical reflectometers, Optical spectrometers, Density (Mass/volume), Particle size, Calibrating, Humidity, Light transmission.
Identifiers: *Air pollution detection, International smoke curve.

The report reviews briefly the background and development of particulate density measurement systems in the United States and Great Britain and discusses the difference in reporting units which has made it impossible, from routine reporting, to make comparisons of particulate density concentrations in the atmosphere between locations in the U. S., using either gravimetric measurement or light reflection techniques, and locations in Great Britain using the International Smoke Curve for estimating concentration. Procedures for the establishment of a relationship between United States reporting units (COh/1000 ft.) and British equivalent units (microgram/cu meter) have been developed and are described in detail. An exploratory study was made for the purpose of investigating possible relationships between particle count differentiated by size range and particulate density in terms of light transmittance and/or light reflectance. Descriptors: (*Plumes, *Atmospheric motion), (*Electric power plants, Air pollution), Design criteria, Flue gases, Chimneys, Meteorological data, Wind (Meteorology), Atmospheric diffusion.

The purpose was to develop a practical, data-based procedure for estimating effective plume rise and plume rise versus distance from a large coal-fired power plants. The results are presented of an investigation of the relationships of the meteorological, plant design, and operating conditions to the: initial plume rise within 152 meters from the source; rate of plume rise with downwind distance; and distance where the maximum rise occurs. More than 1,100 photographs were used in this evaluation, incorporating special methods. For a known stability range, an expression may be determined for estimating the effective plume rise at various distances from the stack. An equation for estimating the effective plume rise at any downwind distance up to 3,000 meters during neutral conditions, stable conditions, and very stable conditions is determined. For a selected downwind distance, an expression is determined for estimating the effective plume rise during any stability conditions. (Author)

COMPLEMENT FIXATION, HEMAGGLUTINATION-INHIBITION, AND TRYPSIN INHIBITORY CAPACITY TESTING OF HUMAN SERA.
Final rept. 2 Mar 71-1 Mar 72,
James K. Noel. 2 Feb 72, 114p APTD-0925
Contract EPA-68-02-0032

Descriptors: (*Influenza virus, *Serology), Immunology, Antigens, Antibodies, Blood serum, Humans, Antigen antibody reactions.
Identifiers: Complement fixation tests, Hemogglutination inhibition tests.

The overall objectives were to carry out 3,000 complement fixation and hemagglutination-inhibition tests on human sera. The four antigens were: Flu A-2/Japan; Flu A-2/Hong Kong/68; Flu B/Maryland; and Flu B/Massachusetts. A total of 3,170 serum samples were each tested with the four Flu antigens. In all tests performed, exactly 4 units of each antigen were used and serum controls were satisfactory. All HAI results are tabulated as the reciprocal of the highest serum dilution which completely inhibited agglutination. The complement fixation (CF) test was performed utilizing Influenza Group A and B soluble antigens. A total of 3,063 serum specimens were tested. All CF results are tablated together with the HAI results. (Author)

SPACE AND TIME VARIABILITY OF SO2 AND PARTICULATE CONCENTRATIONS IN CONNECTICUT,
Norman E. Bowne. Sep 71, 65p APTD-0929
Contract CPA-70-155

Descriptors: (*Connecticut, Air pollution), (*Air pollution, *Atmospheric composition), (*Sulfur dioxide, Air pollution), (*Particulate, Air pollution), Urban areas, Rural areas, Atmospheric diffusion, Diurnal variations, Gas sampling, Statistical analysis, Concentration (Composition).
Identifiers: *Air pollution sampling, Air quality data.

The broad objective was to determine the space and time variability of air quality, on time scales two hours or longer and on a minimum space scale of 5000 feet square in urban, suburban and rural locations and to relate this to the use of monitoring and models in tactical and strategic air quality operations. The state of Connecticut was used for the study. An attempt is made to determine how great a bias might be introduced by improper sampling procedures. Estimates of SO2 concentration were made by two models for four selected areas of the state. Frequency distributions were prepared and the observed data were log-normal. Spatial distributions of air quality model estimates were examined in three regions, one of which was actually a double region in the eastern portion of the state for both models. Modeling for both short and long-term concentration estimates can be performed but it is very clear that a good source inventory is required. This is especially important for short-term models. Identifiers: *Air pollution control.

Concentrated on limestone-sulfur dioxide (SO2) reactions, alkaline additives research has defined the kinetics and capacity as well as the effects of overburning. The kinetics of SO2 sorption by limestone calcines has been determined with a high temperature differential bed gas solids contactor. The effects of particle size, percent conversion of CaO, sulfate loading, pore size, surface area, and geological type of carbonate rock were investigated. The loss of reactivity due to overburning was studied using an oil fired boiler belonging to a power company. Eighty-six carbonate rock samples were tested in a fixed-bed reactor to determine their capacity to react with flue gas containing sulfur dioxide. Although most of the work was performed with the carbonate and the oxide at standard test conditions, supplementary tests were made on hydrates, oxides and carbonates over a wide range of reaction temperatures and calcination conditions. AGRICULTURAL POLLUTION OF THE GREAT LAKES BASIN.

1 Jul 71, 186p W72-04762, EPA-13020-07-71
Combined report by Canada and the United States.
Paper copy available from GPO $1.50 as stock no. 5501-0134, EP2.10:13020-07/71.

Descriptors: (*Water pollution, *Surface water runoff), (*Fertilizers, Water pollution), (*Pesticides, Water pollution), (*Agricultural wastes, Water pollution), (*Great Lakes, Water pollution), Land use, Farm land, Livestock, Nutrients, Soil erosion, Suspended sediments, Forest land, Surface mining, Government policies, United States, Canada, Nitrogen inorganic compounds, Phosphorus inorganic compounds, Organic wastes.
Identifiers: Feedlot wastes, Manure, Eutrophication.

The report concerns pollution abatement in the Great Lakes Basin, specifically influenced by agricultural and related sources, including runoff and release of nutrients, pesticides, herbicides, and degradation by-products as affected by agricultural chemicals, runoff from animal and poultry production, and sedimentation. Current planning, advisory and regulatory functions of the two Governments is discussed. Some basic research of the joint study-group is summarized. Improper manure spreading or storing, and runoff from livestock feeding areas have the greatest potential impact on water quality. Pesticide contribution to environmental contamination is receiving closer scrutiny. The erosion problem is measured in sediment load in streams and deposition rate in reservoirs. High chloride levels, measured in tributary waters, seem related to road salt application. The adequacy of current legislation is discussed. (Author)

Identifiers: *Air pollution control.

The report shows that, among solid sorbents, the most promising class for removal of SO2 from flue gases is cellulose containing materials such as wood, cotton, and newsprint. In particular, it was found that newsprint regenerably sorbs sulfur dioxide from synthetic flue gas streams at operating temperatures. Preliminary engineering designs and estimates of investment and operating costs for control of four sulfur dioxide contamination sources are presented. The process designed for utilizing cellulosics would employ a moving-bed of shredded paper as a sorbent of sulfur dioxide from flue gas streams. The sulfur dioxide is subsequently removed from the paper by thermal desorption for use as a feed stream in sulfuric acid manufacture. (Author)

Identifiers: Cement industry.

Atmospheric emission data is compiled for a wide variety of selected processes. One-half of the 40 processes discussed involve an updating or review of existing emission factors. Except for the combustion and incineration fields, very little new emission factor data has been made public since 1967. Frequently, material balance calculations were made. Detailed information is generally appended to each section. Whenever possible, the range or variation in emission factors is reported. All emission factors were ranked according to the available data upon which they were based. The range of values for many emission factors is large. The factors are presented in these major sections: Stationary Fuel Combustion; Refuse Disposal; Chemical Manufacturing Industries; Food and Agricultural Industry; Metallurgical Industries; Mineral Products Industry; and Organic Solvents. PREDICTION BY NUMERICAL MODELS OF TRANSPORT AND DIFFUSION IN AN URBAN BOUNDARY LAYER. VOLUME I.
Final rept.,
Joseph P. Pandolfo, Marshall A. Atwater, and Gerald E. Anderson. Jul 71, 146p* CEM-4082-FR-Vol-1 APTD-0931

Contract CPA-70-62

Descriptors: (*Air pollution, *Atmospheric models), Mathematical models, Atmospheric motion, Atmospheric diffusion, Mixing, Boundary layers, Wind (Meteorology), Air water interactions, Solar radiation, Temperature gradients, Connecticut, Urban areas, Rural areas, Seasonal variations, Diurnal variations.

A three-dimensional numerical model based on the Eulerian conservation equations for momentum, heat, water vapor, salinity, and air pollutants was used to examine the transport and diffusion processes in the planetary boundary layer. Horizontal diffusion was incorporated through a strongly and implicitly diffusive finite-difference scheme for the horizontal advection terms, viz, upwind differencing. However, terms representing other transport and diffusion processes were explicitly included in the differential equations. It is feasible to simulate the temporal variation of meteorological and pollutant variables, on a three-dimensional array containing several thousand grid points, within practical limits on a computer. Simulated urban-rural low level temperature differences in winter are qualitatively realistic. The simulated daytime vertical profile of pollutants show a well-mixed surface layer with quasi-constant concentrations. The nighttime profiles show definite peaks of concentration near the source height. Three-dimensional fields of meteorological and pollutant variables were simulated using Connecticut source inventory data and typical (hypothetical) winter meteorological conditions. (Author)

Contract EPA-EHSD-71-34

Descriptors: (*Holography, *Flow distribution), (*Particles, Turbulent flow), Laminar flow, Velocity measurement, Air flow, Particle size, Sampler, Laboratory equipment, Air pollution, Boilers.

A technique for measuring the velocity and behavior of particulate suspended in potential and turbulent air flows by means of double-pulsed holography is presented. Descriptions of the air duct facility, particulate dispenser, and holographic systems are provided as well as discussions of experimental results and theoretical considerations. Double-pulsed holography was proved to be an excellent technique for measuring the characteristics of suspended particulate of sizes greater than 6 microns. The measurable characteristics include velocity, three-dimensional coordinates of the particle, size and shape. Specific experiments were performed to determine the feasibility of the double-pulsed holographic technique. These experiments included studies of particulate behavior in electrostatic fields, in potential and turbulent flow, and around a sampling probe for various sampling conditions. (Author)

VALIDATION AND SENSITIVITY ANALYSIS OF THE GAUSSIAN PLUME MULTIPLE-SOURCE URBAN DIFFUSION MODEL.
Final rept.,
Robert C. Koch, and Scott D. Thayer. Nov 71, 351p GEOMET-EF-60 APTD-0935
Contract CPA-70-94

Descriptors: (*Air pollution, *Atmospheric diffusion), (*Plumes, Atmospheric diffusion), Urban areas, Mathematical models, Wind (Meteorology), Emission, Gaussian quadrature, Sulfur dioxide, Computer programs, Concentration (Composition), Predictions, Applications of mathematics.

Identifiers: Gaussian plume model.

The analysis and results are presented of a program of validation and sensitivity analysis of the steady-state Gaussian plume type of urban diffusion model. A definition is developed of the fundamental short-term steady-state model and its various modes of implementation, in terms of emission and environmental input parameters, and of calculational modes. A set of computer programs developed especially for validation and sensitivity study purposes is described. Comparisons were made of short-term and long-term concentration predictions from the model, with comparable measured SO2 concentrations covering three months of two-hour values at ten locations in St. Louis, and one month of one-hour values at eight locations in Chicago. Hourly estimates of meteorological and emission parameters were used.

RESEARCH ON DRY-TYPE COOLING TOWERS FOR THERMAL ELECTRIC GENERATION: PART I.,
John P. Rossie, and Edward A. Cecil. Nov 70, 354p EPA-WQO-1630-EES-11/70, W72-04829
Contract DI-14-12-823
Paper copy available from GPO $2.50 as E P2.10:16130EES11/70.

Descriptors: (*Cooling towers, Thermal power plants), (*Thermal power plants, *Water pollution), Cost analysis, Heat exchangers, Waste water, Industrial waste treatment, Economic analysis.
Identifiers: Water pollution control.

An economic analysis is made for the use of dry cooling towers in thermal power plants in the United States. Twenty-seven sites were examined providing in each case capital and operating cost for natural and mechanical draft systems both for fossil and nuclear plants. System optimization was based on capital cost, auxiliary power cost, cost due to loss of capacity, and fuel cost. Comparison was made with wet cooling tower systems. With all factors considered, dry towers would be economically competitive with wet cooling tower systems.

AVAILABILITY OF LIMESTONES AND DOLOMITES. TASK I.
Final rept.,
J. J. O'Donnell, and A. G. Sliger. 1 Feb 72, 267p*
RED-72-1265 APTD-0932
Contract CPA-70-68

Descriptors: (*Limestone, *Geological surveys), (*Dolomite (Rock), Geological surveys), (*Electric power plants, Limestone), Economic analysis, Demand (Economics), Air pollution, Sulfur dioxide, Adsorbents, Carbonate rocks, Marble, Natural resources, United States, Quarrying, Transportation, Cost estimates.
Identifiers: Air pollution control.

The objective was to determine the availability and costs of limestone and similar materials throughout the contiguous United States, thus providing a basis for determining the feasibility and economics of limestone-based SO2 removal processes for any particular power plant site. Materials covered include limestone, dolomite, chalk, marble, marl, and shell. Information is presented on location of deposits, production rates, F.O.B. quarry costs, transportation methods and costs, expected cost increases, uses, chemical composition, and physical properties. Much of the data is reported nationally, regionally, and on a state-wide basis. The regions were chosen to coincide with those defined by the National Coal Association. The major deposits of carbonate rocks occur in the eastern half of the United States, where the vast majority of fossil fuel-fired power plants are located. Limestone is the only type of carbonate rock which is produced in large enough quantities to merit consideration for widespread application. (Author)

SPRINGFIELD, OHIO. AIR POLLUTANT EMISSION INVENTORY.
David V. Mason. Aug 69, 8p APTD-0840

Descriptors: (*Air pollution, *Ohio), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Springfield (Ohio), Clark County (Ohio).

An emission inventory of the Springfield, Ohio SMSA is presented. The Springfield SMSA is made up of only one county, Clark County, which borders the Dayton SMSA. Clark County's 1967 population was 137,700. The results of the inventory are presented on a grid reference system and in tables. For each of the pollutants (sulfur oxides, particles, carbon monoxide, hydrocarbons, and nitrogen oxides), a summary of the 1967 emissions is tabulated for each of these source categories: transportation (road vehicle, evaporation); combustion of fuels in stationary sources (industry, steam-electric, residential, commercial); refuse disposal (incineration, open burning); and industrial process. MIXING HEIGHTS, WIND SPEEDS, AND POTENTIAL FOR URBAN AIR POLLUTION THROUGHOUT THE CONTIGUOUS UNITED STATES,
George C. Holzworth. Jan 72, 126p AP-101
Paper copy available from GPO $1.25 as EP4.9:101.

Descriptors: (*Air pollution, *Atmospheric motion), (*Urban areas, Atmospheric motion), Forecasting, Temperature inversions, Wind (Meteorology), Climatology, Seasonal variations, Mixing, Graphs (Charts), Wind velocity, Dispersing.
Identifiers: *Air pollution forecasts, *Air pollution episodes.

There is interest in pertinent climatological information and an overall appraisal thereof in terms of quantitative pollution potential. As used here, the

potential for urban air pollution refers to certain meteorological factors that generally are important in the transport and diffusion of pollutants emitted by myriad but non-trivial sources in urban complexes. The mixing-layer height and the average wind speed within the mixing layer were calculated twice for each day of a 5-year record of upper air observations at 62 National Weather Service stations in the contiguous United States. These calculations illustrate the typical large diurnal variation in atmospheric dispersion. Twenty charts present seasonal and annual, and morning and afternoon mean mixing heights and wind speeds. A model of some general dispersion features over urban areas is described in which the normalized pollutant concentration averaged over a city is a function of mixing height, wind speed, and city size (distance the wind travels across the city). Isopleths of the total number of episode-days for episodes lasting at least 2 days and at least 5 days with various limiting mixing-height and wind-speed values are presented in 20 charts. (Author)

A STUDY OF AIRCRAFT POWERPLANT EMISSIONS.
Final rept.,
Anthony F. Souza. 3 Jan 71, 266p APTD-0916
Contract EPA-68-04-0037

Descriptors: (*Air pollution, Exhaust gases), (*Aircraft engines, *Exhaust gases), Piston engines, Gas turbine engines, Spark ignition engines, Gas analysis, Concentration (Composition), Test engines, Carbon monoxide, Hydrocarbons, Nitrogen oxides, Aldehydes.

Emissions from forty-two light aircraft piston engines and twenty-six military gas turbine engines have been measured and documented. Piston engine aircraft were leased from local general aviation suppliers and the engine exhaust emissions tested using a ten mode test cycle during a ground run-up. In addition crankcase ventilation emissions were measured on six engines and mass emission rates were calculated. Exhaust component concentrations and fuel consumption rates were measured at specified engine operating conditions. The exhaust analyzer readings were converted to pollutant concentrations and mass emission rates. The data were analyzed to determine engine-to-engine variations for each model engine, the effect of hot versus cold start, and the role of engine operating parameters. (Author)

COST NOMOGRAPHS OF SELECTED SULFUR DIOXIDE ABATEMENT METHODS.
Jan 72, 148p* HIT-508 APTD-0919
Contract EHSD-71-43

Descriptors: (*Air pollution control equipment, Cost comparison), (*Air pollution, Sulfur dioxide), (*Electric power plants, Air pollution control equipment), (*Sulfur dioxide, Air pollution control equipment), Cost estimetes, Nomographs, Coal, Fuel oil, Desulfurization, Transportation, Adsorption, Injection, Limestone, Magnesium oxides, Vanadium oxides, Vanadium oxides, Capital costs, Operating costs.
Identifiers: *Air pollution control, Molten carbonate process, TYCO process, Magnesium oxide scrubbing, Limestone injection, Cat-Ox process, Waste gas recovery.

The results are presented of a study which was undertaken to provide a basis for assessing the costs and effectiveness of alternative sulfur dioxide control systems for emissions of fossil fuel combustion from power generating facilities. The study attempts to provide a set of nomographs which would allow rapid and accurate assessment of these control alternatives. Sulfur emissions can be controlled by either stack gas control processes, desulfurization of oil or coal, or the burning of naturally-occurring low sulfur fuels. The economic aspects involved are the capital and operating costs of stack gas and desulfurization facilities and the incremental costs of purchasing and shipping low sulfur fuels. The most current technical and economic data were compiled and evaluated for six stack gas processes. The costs per ton of coal or per barrel of oil were determined given a variety of conditions. The cost of transporting bulk reactants or low sulfur fuels can be significant when studying control economics. (Author)

POLLUTION ABATEMENT AND UNEMPLOYMENT. A METHODOLOGICAL STUDY,
John Hoicka, Terry Trumbull, and Helen Scott. 31 Jan 72, 154p* APTD-0921
Contract EHS-70-126

Descriptors: (*Industrial plant efficiencies, Pollution), (*Pollution, *Economic conditions), (*Unemployment, Pollution), (*Air pollution, Economic conditions), (*Water pollution, Economic conditions), Economic analysis, Industrial plants, Financing, Abatement, Government policies, Prices, Iron and steel industry, Foundries, Cost estimates.
Identifiers: Cement industry, Copper industry, Air pollution control, Water pollution control.

A report is presented of a study which develops a methodology to estimate the magnitude of unemployment that may be expected as a result of plant closures caused by pollution abatement requirements. This study is directed at the very small minority of plants that might reduce or cease operations and thereby lay off their employees. The report specifies the types of financial assistance required to avoid closure, and describes the kinds of plants affected and programs which might be instituted, should the need arise. The study also provided insights into the appropriate types of Federal Government response, should the magnitude of unemployment warrant action. (Author)

John R. Ehrenfeld, Ralph H. Bernstein, Katherine Carr, Josette C. Goldish, and Ronald G. Orner. Jul 71, 340p* APTD-0924
Contract CPA-22-69-85

Descriptors: (*Air pollution, Combustion products), (*Electric power plants, Air pollution), (*Air pollution control equipment, *Furnaces), Boilers, Sulfur dioxide, Nitrogen oxides, Particles, Forecasting, Inventories, Cost estimates, Economic analysis, Fuel oil, Coal, Natural gas, Fly ash.
Identifiers: *Air pollution control.

The electric power industry is one of the major stationary-source contributors to air pollution. A basis is provided for assessing the relative significance of this class of sources and for establishing a research and development plan to develop control means. The pollutant sources are identified according to equipment type and size, regional distribution, fuel, user, age and other factors of significance to air pollution emissions. Estimates of installed capacity were made for the base year - 1967, with projections for 1975, 1980, 1985, 1990. Only intermediate-size conventional boilers were included. Boilers were broken down according to type and size. Annual emissions of SO2, NO (x) and particulates were computed by applying a series of operating factors (boiler efficiency, load factor, etc.) to the capacity inventory using a computer program (STRAT). The identification and the analysis of the cost-effectiveness of possible control approaches was also made. The major strategies examined included: fuel switching; flue gas treatment; and combution modification. Process designs and costs data were developed. The STRAT program was used to assess the relative cost and effect on pollutant reduction of a variety of different strategies. (Author)

AIR QUALITY CONSIDERATIONS IN TRANSPORTATION AND URBAN PLANNING. A FIVE-YEAR PROGRAM GUIDE.

Dec 71, 199p* APTD-0933
Contract CPA-70-100
Prepared in cooperation with Ryckman, Edgerley, Tomlinson and Associates, St. Louis, Mo.

Descriptors: (*Air pollution, *Urban planning), (*Transportation, Air pollution), Urban areas, Land development, Land use, Demography, Mass transportation, Exhaust gases, Highway transportation, Air transportation, Atmospheric motion, Urban transportation, Land use zoning, Law (Jurisprudence).

The scope of the research described was to determine and demonstrate the air pollution aspects of urban and transportation planning and to encourage the inclusion of air quality control considerations in the planning process. The need for the study is based on the fact that urban planning decisions, which have profound effects on ambient air quality, are often made without proper consideration of their air pollution consequences. The recommendations include a summary of the basic work items for the five-year program of research and support activities. The contribution that urban and transportation planning can make to the improvement of air quality was developed. The inter-relationships between air pollution, land use, and transportation systems are described, based on an intensive state-of-the-art review. The role of urban and transportation planning in air quality control is discussed in the following contexts: land development and density patterns; spatial arrangement of buildings and site activities; planning of transportation systems; design and construction practices; and operation of buildings and transportation facilities. Identifiers: *Molten carbonate process, *Air pollution control, Air pollution economics, *Waste gas recovery, Claus process, Copper industry.

The Molten Carbonate Process for the removal of sulfur oxides from power plant stack gases has been evaluated. The purpose of the evaluation was to advise on the continued course of action regarding this process. The removal of sulfur oxides from an 800 MW power plant operated with coal containing 3% sulfur was selected as a base case. Alternate cases involving coal-burning power plants were included. Various copper smelter situations were also reviewed. Process and engineering problem areas were identified and potential solutions were examined. Cost estimates are given detail. The process converts recovered sulfur oxides successively to sulfides and H2S. (Author)

Identifiers: *Automobile exhaust, Catalytic reactors (Exhaust systems), *Air pollution control, Molten salt scrubbers.

The report describes work carried out on a research program to characterize and trap particulate emissions from automotive power plants. The report describes the characterization of particulate matter emitted from automotive power plants operating on leaded gasoline. Particle characterization was carried out with a dynamometer controlled engine operating at the equivalent of 60 mph cruise, 30 mph cruise, and under mild cycling conditions. The development of an exhaust particle-trap device is also described. Also described is the characterization of particulate emissions from automotive power plants operating on nonleaded fuels. Changes in the particulate emissions were determined at a rich and lean air/fuel ratio and in the presence of two catalytic converters. Particle mass emission rates, particle mass-size distributions, and total aldehyde emissions were measured. (Author)

Descriptors: (*Air pollution, Exhaust gases), (*Gas turbine engines, *Exhaust gases), (*Aircraft engines, Exhaust gases), Turbofan engines, Gas sampling, Samplers, Design, Gas analysis, Smoke, Particles, Alkene hydrocarbons, Aldehydes, Hydrocarbons, Nitrogen oxides, Static tests.
Identifiers: *Aircraft exhaust.

A report is presented of a study in which the design and fabrication of a multipoint sampling rake was completed. A check-out test of the rake using a JT9D experimental engine indicated that the exhaust emission sample obtained from the rake was very close to the average of the samples obtained from the individual probes located adjacent to the 12 rake sampling points. This probe was then used to sample the exhaust emission from an experimental engine of each of the JT3D, JT8D, and JT9D engine models, plus production engines. All of the mass emission results obtained during the program were subjected to a statistical analysis. The results of this analysis were then used in a hypothetical aircraft operational cycle. Measurements of smoke, dry particulates, total particulates, aldehydes, and olefins were also recorded. (Author)

Identifiers: Water pollution economics, Referendums, *Bond issues.

Defeat of a pollution control bond in a local community can result in a significant delay in the implementation of the Federal Water Pollution Control Act. Hence, it is important that the Environmental Protection Agency understand what factors affect the outcome of municipal bond elections so that it can offer assistance wherever possible. Initial statistical investigation identified 34 independent variables associated with the outcome of bond elections in a non-random pattern. Regression analysis then identified eleven variables which together explain 62% of the variance in the outcome of bond elections for water pollution control. These eleven variables can be grouped into four categories: population characteristics, community characteristics, characteristics of the bond issue, and campaign characteristics. (Author)

Identifiers: *Water pollution control, Oneida Lake, *Onondaga County (New York).

The report is concerned with the implementation of pollution abatement at a local level of government. The report is in three parts. The first contains a discussion of the past practices and recent trends in water pollution control as it relates to water quality. Next the dollar benefit of a lake or stream at a given water quality is determined by listing all uses which both affect and are affected by water quality, by valuing each use individually, and by summing the resultant values. Finally a study was undertaken of a methodology for water pollution abatement administration at the local or regional level, using Onondaga Lake, N. Y. as an example. (Author)

Identifiers: Depolymerases.

Improved dewatering of sewage sludge has been accomplished for the first time by biological means; namely, through the agency of the enzyme lysozyme acting under controlled conditions. Improved dewatering was measured by a 4 to 8-fold increase in filtration rate, which, if extrapolated to plant scale operations, should result, in a given time period, in a 2 to 3-fold increase in solids yield, thus achieving a significant cost saving. A number of other exo- and endo-enzymes were also tested for their effects on dewatering, with uncertain results. Several microorganisms were isolated that showed lysis around their colonies when they were grown on agar plates containing sludge. Of major significance is the demonstration that the relative mild conditions of a biological process permit attacking the sludge dewatering process at its source - the matrix material. (Author)

ENGINEERING AND COST EFFECTIVENESS STUDY OF FLUORIDE EMISSIONS CONTROL. VOLUME I.
Final rept.,
J. M. Robinson, G. I. Gruber, W. D. Lusk, and M. J. Santy. Jan 72, 410p* SN-16893-000 APTD-0945
Contract EPA-EHSD-71-14
Prepared in cooperation with Resources Research, Inc., McLean, Va.

Descriptors: (*Air pollution, *Fluorides), (*Air pollution control equipment, Fluorides), Economic analysis, Cost effectiveness, Industrial wastes, Aluminum industry, Iron and steel industry, Electric power generation, Coal, Combustion products, Phosphate deposites, Benefication, Glass industry, Smelting, Alkylation, Hydrogen fluoride, Chemical industry, Metal industry, Trends, Clays, Cost estimates, Gas sampling, Public health.
Identifiers: *Air pollution economics, *Air pollution control, Cement industry, Air pollution detection, Air pollution effects (Plants), Air pollution effects (Animals), Air pollution effects (Materials).

The results of a study are presented in which primary emphasis has been placed upon the determination of the engineering and cost effectiveness of control of soluble fluoride emissions from the major industrial sources. The report presents the following information: Industry by industry descriptions of each production and control process of significance from a fluoride emission control standpoint; Discussions of production trends extrapolated to the year 2000; process flow diagrams and mass balances for typical current plants; estimates of current and projected fluoride emissions; Analysis of production and control process economics; Descriptions, cost estimates, priority assignments and schedules for the additional research and development programs recommended as the result of this study; Environmental and ecological effects of the emitted fluorides; and Techniques for sampling, and measurement of

fluoride pollutants in the various effluent streams. (Author)

INTERIM REPORT, UPPER KLAMATH LAKE STUDIES, OREGON.
Water pollution control research series,
William E. Miller, and Jerry C. Tash. Sep 67, 45p WP-20-8 W72-06052, FWPCA-16010-09/67

Descriptors: (*Limnology, *Nutrients), (*Lakes, Limnology), (*Algae, Limnology), Water analysis, Sediments, Fresh water biology, Tracer studies, Carbon 14, Radioactive isotopes, Water pollution, Benthos, Surface water runoff, Oregon, Primary biological productivity.
Identifiers: *Eutrophication, Klamath Lake, Aphanisomenon.

The water quality in Upper Klamath Lake watershed, Oregon, is defined. The sources of algal nutrients and other constituents in water flowing into and out of Upper Klamath Lake are identified and the quantity of these constituents is compared in pristine streams, canals, rivers, agricultural drainage, and springs. Chemical analyses were made of algae, lake sediment and bottom fauna samples. Algal species were identified and measured. Aphanizomenon flos-aquae represented about 90-99 percent of the total algal crop during the summer. Limiting nutrient studies using the isotope Carbon-14 to measure variations in primary productivity were conducted in situ and in the laboratory. (Author)

FIELD STUDIES ON SEDIMENT-WATER ALGAL NUTRIENT INTERCHANGE PROCESSES AND WATER QUALITY OF UPPER KLAMATH AND AGENCY LAKES, JULY 1967-MARCH 1969,
A. R. Gahler. Oct 69, 61p Working Paper-66 W72-06051, FWPCA-16010-10/69

Descriptors: (*Limnology, *Sediment transport), (*Nutrients, Sediment transport), Lakes, Algae, Wind (Meteorology), Mixing, Benthos, Diffusion, Water analysis, Dissolved gases, Oregon, Phytoplankton.
Identifiers. *Eutrophication, Klamath Lake.

Studies of algal nutrient interchange between sediment and water under environmental conditions were carried out in Upper Klamath Lake, Oregon. Experimental 'pools' of lake water in contact with the sediment and experimental pools of water not exposed to the sediment were compared with the open lake. Water quality measurements were made to determine whether interchange processes could be observed directly in the water, to establish conditions for laboratory interchange tests, and to compare lake conditions with the experimental pools. Interchange definitely occurred when Oscillatora floated to the lake surface with attached sediment which contained soluble nitrogen and phosphorus compounds. The effects of gas evolution, wind, currents, fish, boating, benthos, diffusion, etc., on the shallow lakes was not quantitatively determined, but it seems quite probable that anything that stirs the sediment causes interchange of nutrients. INDUSTRIAL WASTE GUIDE ON LOGGING PRACTICES.

Feb 70, 82p* W72-06053, FWPCA-13010-02/70
See also Rept. no. PB-197 262.

Descriptors: (*Water pollution, *Industrial wastes), (*Lumbering, Water pollution), (*Surface water runoff, Water pollution), Water quality, Suspended sediments, Forest land, Heat, Erosion control, Roads, Vegetation, Clearing.
Identifiers: *Water pollution control, Thermal pollution.

Logging is an industrial activity which takes place in the commercial forest lands covering 40 percent of the land area of the Pacific Northwest. Logging can--and at many locations does--degrade the quality of water in the streams draining the forest lands. The report is dedicated to the logging practices which must be adopted by the logging industry if water quality is to be protected in the streams of the Pacific Northwest. An adequate tree harvesting plan includes maps, sketches, or pictures of the area to be harvested. Specifications are given for the building, use, and maintenance of a well-designed transportation system. Sections deal with logging roads, tree cutting, log yarding, buffer strips, watershed restoration, and municipal water supply watersheds. (Author)

REVERSE OSMOSIS RENOVATION OF PRIMARY SEWAGE.

Feb 71, 62p W72-06054, EPA-EQO-17040-EFQ-02/71
Contract EPA-WQO-14-12-885
Paper copy available from GPO $0.65 as EP2.10:17040EFQ02/71.

Descriptors: (*Sewage treatment, *Osmosis), Fouling, Flux (Rate), Flocculating, pH control, Suspended sediments, Membranes, Precipitation (Chemistry), Calcium sulfates, Enzymes, Detergents.
Identifiers: *Reverse osmosis.

A reverse osmosis pilot plant was operated on both primary and secondary effluent and the results compared. Data indicated that high axial feedwater velocities were necessary to prevent membrane fouling. The main substances causing fouling were suspended particulates, inorganic salt precipitates, and dissolved organic matter, as well as some other substances which are unknown at this time. Suspended particulates were flocculated, settled, and filtered out of the wastes, inorganic salt precipitation was controlled by pH adjustment, except in the presence of calcium sulfate, and dissolved organic matter can be removed by biological treatment. Cleansing the membrane with an enzyme-active laundry presoak formulation proved beneficial for both wastes. (Author)

Beet Sugar Development Foundation, Fort Collins, Colo.
STATE-OF-ART, SUGARBEET PROCESSING WASTE TREATMENT.
Water pollution control research series.

Jul 71, 150p W72-06055, EPA-WQO-12060-DSI-07/71
Paper copy available from GPO $1.25 as EP2.10:12060DSI07/71.

Descriptors: (*Water pollution, *Industrial wastes), (*Food processing, *Industrial waste treatment), (*Sugar beets, Food processing), (*Waste disposal, Food processing), Reviews, Sugar, Biochemical oxygen demand, Industrial water, Precipitation (Chemistry), Cooling water, Calcium carbonates, Molasses, Western Europe, United States.
Identifiers: *Water pollution control, *Solid waste disposal, Steffen waste, *Sugar beet processing.

The United States beed sugar industry produces annually in excess of 3 million tons of sugar from about 25 million tons of beets grown in 19 states. Discharge of wastes has dropped from 30 to 40 lbs BOD/ton of beets sliced to 3.15 lbs BOD/ton of beets sliced, but the total annual discharge is still 79 million pounds of BOD. Fifty-eight beet sugar factories operating in 1968-69 were studied as to waste disposal practices, amounts of water used, and water re-use practices. Main water usages are flume or transport water, process water, lime mud, condenser water, Steffan dilution water, and miscellaneous other uses. Sedimentation ponds and clarifiers are the most widely used solids separation processes, but much of the waste disposal problem is eliminated by recycling, to the extent that several of the plants studied had no effluent BOD discharges. No average waste treatment costs for the industry were presented, since such costs are subject to such a wide plant to plant variation. Needed research is outlined, and a brief description of the entire beet sugar process is presented. Current practices in several Western European countries are also presented. (Author)

PITTSBURGH METROPOLITAN AREA AIR POLLUTANT EMISSION INVENTORY,
Michael J. McGraw, and Charles S. Holt. Nov 68, 64p APTD-0895

Descriptors: (*Air pollution, *Pennsylvania), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Metal industry, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Waste disposal, Demography.
Identifiers: *Air quality data, *Pittsburg (Pennsylvania), Allegheny County (Pennsylvania), Beaver County (Pennsylvania), Washington County (Pennsylvania), Westmoreland County (Pennsylvania).

A report is presented of the results of an emission inventory of air pollutant sources in the Pittsburgh, Pennsylvania, Metropolitan Area. A modified version of the rapid survey technique was used. The objectives of the study were to determine the total quantities of the various air pollutants emitted and to estimate their seasonal and geographical variation. To accomplish this task, the study area was divided into a grid coordinate system, and the emission quantities were reported in terms of tons of pollutant per grid for a summer, winter, and average day. The pollutants considered were sulfur oxides, particulates, carbon monoxide, nitrogen oxides and hydrocarbons. All major source categories except solvent evaporation were included in the survey. Descriptors: (*Air pollution, *Montana), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Seasonal variations, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Billings (Montana), Stillwater County (Montana), Yellowstone County (Montana), Carbon County (Montana).

A summary of the emission inventory for the Billings, Montana Metropolitan Area is presented. The report provides estimates of the present levels of air pollutant emissions and status of their control. The pollutants which include sulfur oxides, particulates, carbon monoxide, hydrocarbons, and nitrogen oxides are delineated with respect to source type, season of the year, and geographical distribution within the area. The Study Area, which was chosen on the basis of the size and distribution of its population and its air pollution sources, consists of three counties. A grid coordinate system was used to show the geographical distribution of emissions within counties. All sources of emissions were classified into five categories: transportation, stationary fuel combustion, solid waste disposal, industrial processes, and evaporative losses. (Author)

Identifiers: *Air quality data, *Atlanta (Georgia), Fulton County (Georgia), Dekalb County (Georgia), Cobb County (Georgia), Henry County (Georgia), Gwinnett County (Georgia), Clayton County (Georgia), Douglas County (Georgia).

A report is presented of the emission inventory of the Atlanta Metropolitan Area, Georgia. Estimates are provided of total emissions of oxides of sulfur, oxides of nitrogen, hydrocarbons, carbon monoxide and particulate matter. The emissions of these pollutants are delineated with respect to source type, season of the year as well as their geographical distribution with the area. These surveys are also intended to determine the present level of emissions and status of their control. The general procedure for the survey is based on the rapid survey technique. The emissions are expressed in terms of tons of pollutants for an average annual, summer, and winter day. (Author)

Descriptors: (*Air pollution, *Connecticut), (*Massachusetts, Air pollution), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Seasonal variations, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data.

A summary report is presented of the emission inventory for the Mid-Connecticut Lower Pioneer Valley. The survey provides estimates of the present levels of air pollutant emissions and status of their control. The pollutants which include sulfur oxides, particulates, carbon monoxide, hydrocarbons, and nitrogen oxides are delineated with respect to source type, season of the year, and geographical distribution within the area. The Study Area, which was chosen on the basis of the distribution of population and air pollution sources, consists of 103 cities and towns in portions of Connecticut and Massachusetts. A grid coordinate system was used to show the geographical distribution of emissions within the area. All sources of emissions were classified into four categories: transportation, stationary fuel combustion, solid-waste disposal, and industrial processes. Emissions were estimated by using various indicators such as fuel consumption, refuse burining rates, vehicle-miles, production data, and control efficiencies and emission factors relating these indicators to emission rates. A summary is presented of the emission inventory for the Salt Lake City Metropolitan area, Utah. The report provides estimates of the present levels of air pollutant emissions and status of their control. The pollutants which include sulfur oxides, particulates, carbon monoxide, hydrocarbons, and nitrogen oxides are delineated with respect to source type, season of the year and geographical distribution within the area. The Study Area which 2as chosen on the basis of the distribution of population and air pollution sources, consists of seven counties surrounding the cities of Salt Lake City, Provo and Ogden. A grid coordinate system was used to show the geographical distribution of emissions within counties. All sources of emissions were classified into five categories: transportation, stationary fuel combustion, solid-waste disposal, industrial processes and evaporative losses. (Author)

TREASURE VALLEY, IDAHO AREA, AIR POLLUTANT EMISSION INVENTORY,
David S. Kircher. Jun 70, 60p APTD-0833

Descriptors: (*Air pollution, *Idaho), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Seasonal variations, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Payette County (Idaho), *Canyon County (Idaho), *Ada County (Idaho), *Elmore County (Idaho), *Boise County (Idaho), *Gem County (Idaho).

A summary of the emission inventory for the Treasure Valley, Idaho Metropolitan Area is presented. The pollutants which include sulfur oxides, particulates, carbon monoxide, hydrocarbons, and nitrogen oxides are delineated with respect to source type, season of the year, and geographical distribution within the area. The Study Area, which was chosen on the basis of population distribution and air pollution sources, consists of six counties in the western portion of the state of Idaho. A grid system was used to show geographical distribution of emissions within each of the counties. All sources of emissions were classified into five categories: transportation, stationary fuel combustion, industrial processes, refuse, and evaporative losses. (Author)

AIR QUALITY IMPLEMENTATION PLAN FOR THE STATE OF ALASKA. VOLUME I. CONTROL STRATEGY.

Dec 71, 102p 18425.007 APTD-0926
Contract DI-68-02-0048

Descriptors: (*Air pollution, *Alaska), (*Government poliicies, Air pollution), Regulations, Planning, State government, Abatement, Sulfur oxides, Particles, Carbon monoxide, Nitrogen oxides, Oxidizers, Hydrocarbons, Combustion products, Industrial wastes, Transportation, Fuels, Strategy, Sources, Inventories, Standards, Ice fog.
Identifiers: *Implementation Air Pollution Planning Program, *Air quality data, *Air pollution standards, Air pollution abatement.

The report presents a control strategy designed to achieve and maintain air quality in Alaska that is within the National Ambient Air Quality Standards. The control strategy consists of a set of control measures and procedures to be carried out and enforced by the State and Regional Air Quality Control Agencies. The document presents a technical summary of the Strategy. Section 1 presents an executive summary of the Strategy. It describes briefly the air quality problem in Alaska, it discusses the background for the problem solution and presents the control strategy. The subsequent four sections treat details of control Strategies for each of the four Alaska Air Quality Control Regions. These sections present, for each region, the region description, the existing regional air quality, the sources of pollutants, the proposed control strategy and finally the economic aspects of the control Strategy. F-0303 APTD-0951
Contract EPA-EHSD-71-9

Descriptors: (*Waste heat boilers, *Incinerators), (*Refuse disposal, Urban areas), (*Heat recovery, Incinerators), (*Refuse, *Fuels), Air pollution, Garbage disposal, Sulfur, Design criteria, Cost estimates, Operating costs, Capital costs, Pennsylvania, Ohio, Steam electric power generation, Combustion products.
Identifiers: *Low sulfur fuels, *Solid waste disposal, *Air pollution control, Philadelphia (Pennsylvania), Cleveland (Ohio).

The purpose of the present study was to develop for two major cities, design recommendations and procedures for the disposal of refuse, a low sulfur fuel, with heat recovery in utility grade boilers. An earlier study in this area resulted in the identification of optimal system design configurations and quantification of benefits to the environment and the economy. The program has applied that knowledge to specific case study areas. Arrangements with two cities having high SO2 burdens and growing solid waste burdens were made; these were Philadelphia, Pennsylvania, and Cleveland, Ohio. Information required for the study was collected and analyzed. Specific design packages were then developed for each city. The report presents projections describing the future nature of the city refuse-fuel inventories, specific recommendations as to plant types, sizes, and sites, cost analyses of operations involving the utilization of such systems, and estimated reduction in SO2 and particulate emissions. From these data, the conclusion can readily be drawn that the systems recommended would be more cost-effective than the methods that are now in use. (Author)

Descriptors: (*Radiotherapy, Meetings), (*Radiation hazards, Radiotherapy), Malignant neoplasms, Therapy, Radium, Dosimetry, Exposure, Radiation dosage, Computers.
Identifiers: Afterloading.

These proceedings include the formal presentations, edited transcripts of the discussions, and an appendix containing presentations by representatives of commercial suppliers of afterloading materials and equipment. The first session of the conference was devoted to discussions of the hazards of radium and radium substitutes in the treatment of cancer, the development and current status of afterloading techniques in various nations, and the use of computers in radiotherapy. Speakers at the second session discussed dosimetry, treatment of cancer of the uterus, and interstitial techniques. In the third session, there was an open discussion on standardization of afterloading sources.

Identifiers: *Diesel exhaust, Catalytic reactors (Exhaust systems).

A ten-person odor panel, trained in the characterization of dilute diesel exhaust samples according to the PHS quality/intensity rating kit and the PHS light-extinction smokemeter, were used to measure odor and smoke. Evaluation was made of several two-cycle powered municipal buses equipped with automotive type catalytic devices. The smoke suppressing ability of a barium diesel fuel additive was successfully demonstrated in a five-truck fleet. Power rating had a pronounced effect on visible smoke output, although it appeared to have little or no effect on perceived odor. A limited study of the effect of injecting air in the exhaust at the underside of exhaust valves of a two-cycle powered municipal bus had a negligible effect, while a brief evaluation of the Jacobs engine brake also resulted in no noticeable change. Special studies were conducted and reported, including the effect of exhaust pipe size on smoke readings, preliminary studies of a tentative PHS smoke procedure, attempted evaluation of an electrostatic precipitator, and base line odor, smoke, and emissions from a municipal coach powered by a four-cycle V8 engine. (Author)

Final rept.,
Karl J. Springer. Oct 69, 783p SwRI-AR-695
APTD-0940
Contract PH-22-68-23

Descriptors: (*Air pollution control equipment, Diesel engines), (*Diesel engines, *Exhaust gases), (*Air pollution, Exhaust gases), (*Odors, Diesel engines), (*Smoke abatement, Diesel engines), Smoke, Particles, Odor detection, Buses (Vehicles), Motor trucks, Electrostatic precipitators, Catalytic converters, Fuel additives, Odor control, Dynamometers, Acroleins, Carbon monoxide, Nitrogen oxides, Aldehydes, Tables (Data).
Identifiers: *Diesel exhaust, Catalytic reactors (Exhaust systems).

A ten-person odor panel, trained in the characterization of dilute diesel exhaust samples according to the PHS quality/intensity rating kit and the PHS light-extinction smokemeter, were used to measure odor and smoke. A commercially available diesel fuel odor additive had no effect on perceived odor from three two-cycle Detroit diesel 6V-71 E powered municipal buses, and inconsistent reductions in odor generally resulted from a catalytic muffler device. Both odor and smoke were less from similar buses powered by a 6V-71 N type engine. A number of truck-tractors with a variety of engines and drivelines were evaluated to develop dynamometer procedures and acquire limited baseline emissions. Due to low exhaust temperature and unsteady flow conditions with extended engine idle, the city bus exhaust represents one of the most difficult to treat by catalysis, and a number of catalytic devices employing both transition metal and precious metal catalyst coatings were unsatisfactory. An electrostatic precipitator was completely unsuccessful in reducing smoke. Fuel seemed to have little or no effect on perceived odor from three buses powered by 8V-71 N engines. (Author)

THERMOELECTRIC GENERATORS POWERED BY THERMAL WASTE FROM ELECTRIC POWER PLANTS,
Mostafa A. Shirazi. Oct 70, 30p W72-06586, EPA-WQO-16130-10/70
Paper copy available from GPO $0.45 as EP2:10:1613-10/70.

Descriptors: (*Electric power generation, *Heat recovery), (*Thermoelectric power generation, Heat recovery), Thermal power plants, Feasibility, Flue gases, Heat exchangers, Cost estimates, Condensers (Liquefiers), Heat transfer.
Identifiers: Thermal pollution.

The feasibility of recovering electricity from the waste heat of electric power plants was assessed. Sources considered were: stack flue gas, gas-turbine exhaust, and condensing steam. Typical 1600 MW fossil-fuel steam plants and gas-turbine plants were used as examples. Flat plate heat exchangers were designed with thermoelectric couples arranged in series within the plates. Heat flux, conversion efficiencies, and flow friction losses were calculated. Except for the condenser application, the friction losses are several times the thermoelectric power generated. Under favorable conditions, 3 to 9 MW is obtainable from the thermoelectric condensers. The high material cost, however, precludes all such applications today. (Author)

Identifiers: *Thermal pollution.

The energy budget approach to cooling ponds has been outlined and applied. Monthly average weather data from 88 stations throughout the U.S. were used to calculate equilibrium temperatures, heat exchange coefficients, and amount of cooling in various sized ponds receiving the effluent from a standard power plant of 1000-mw capacity, both for average and extreme weather conditions. The data for each station are shown on a chart, and the variation of these results across the U.S. is depicted by a series of 28 maps of the U.S. with contours connecting equal values of the parameters. The results may also be used to estimate cooling pond performance for other sized power plants. The maps disclose variations across the U.S., on a given date, of up to 55F in equilibrium temperature, up to 100% difference in heat exchange coefficients, up to 50% difference in heat lost from a given sized pond, and up to 200% difference in the size of a pond necessary to produce an equal cooling effect. Identifiers: *Thermal pollution.

Mathematical models for heated water outfalls were developed for three flow regions. Near the source, the subsurface discharge into a stratified ambient water issuing from a row of buoyant jets was solved with the jet interference included in the analysis. The analysis of the flow zone close to and at intermediate distances from a surface buoyant jet was developed for the two-dimensional and axisymmetric cases. Far away from the source, a passive dispersion model was solved for a two-dimensional situation taking into consideration the effects of shear current and vertical changes in diffusivity. A significant result from the surface buoyant jet analysis is the ability to predict the onset and location of an internal hydraulic jump. Prediction can be made simply from the knowledge of the source Froude number and a dimensionless surface exchange coefficient. Parametric computer programs of the models are also developed. (Author)

Identifiers: Thermal pollution.

The report is part of a larger study to perform a technical and economic survey of alternate methods for cooling condenser discharge water from thermal power plants. The criteria by which the power plants themselves are designed and optimized are described. These criteria are both technological and economic. The general aspects of power plant selection are reviewed. Design and cost optimization procedures are also reviewed. This includes capital costs for the turbine-generator units and for the boilers. Operating costs are computed based on constant incremental running rates. An example is carried to the point of a present worth evaluation. The use of feed-water heaters, and single- and multi-pressure condensers is described. Some operational considerations including instrumentation and control and plant layout are discussed briefly. Identifiers: *Cooling ponds, *Thermal pollution, Water pollution control.

Various types of heat transfer equipment which would be applicable to the task of dissipating condenser discharge heat from large power plants are identified. Their performance is analyzed, performance prediction methods are presented, and the capital and operating costs are given. Information including sizing procedures, capital and operating cost, duty maintenance requirements, and possible secondary pollution considerations are presented for candidate systems such as once-through cooling, cooling ponds, spray ponds, wet cooling towers, dry cooling towers, evaporation condensers, and air-cooled condensers. Operational considerations are discussed including the theory of operation. Criteria are developed for the selection of an optimum unit given a particular geographic location, capacity requirements, and economic constraints. (Author)

MATHEMATICAL MODELING AND COMPUTER SIMULATION FOR DESIGNING MUNICIPAL REFUSE COLLECTION AND HAUL SERVICES.
Final rept.,
S. Wersan, J. Quon, and A. Charnes. 1971, 447p*
EPA-SW-6R-G-71
Grant PHS-UI-00699

Descriptors: (*Refuse disposal, Mathematical models), (*Collection methods, Refuse disposal), Computerized simulation, Hauling, Cost estimates, Systems analysis, Waste disposal, Optimization, Site surveys, Illinois, Computer programs, Operating costs.
Identifiers: *Solid waste disposal, Chicago (Illinois), Winnetka (Illinois).

Current solid waste collection practices do not differ significantly from those used at the turn of the century. This lag in the development of new technologies has had a marked economic impact. Ways must be found, therefore, to maximize efficiency while minimizing costs. The first part of the report concentrates on the haul operation through a study of mathematical models for the location or selection of disposal sites and the allocation of collection territories thereto. The second part is concerned with an operational analysis of the collection and haul operations combined, done with the use of two computer programs expecially written for the simulation of the operation of refuse systems. SUPPLEMENTARY AERATION OF LAGOONS IN RIGOROUS CLIMATE AREAS.
Water pollution control research series,
Robert L. Champlin. Oct 71, 76p W7206838, EPA-17050-DVO-10/71
Paper copy available from GPO $0.75 as EP2.10:17050DVO-10/71.

Descriptors: (*Sewage treatment, *Cold weather tests), (*Lagoons (Ponds), Sewage treatment), Aeration, Design, Biochemical oxygen demand, Settling, Performance evaluation.

A pilot scale field investigation of the effects of supplemental aeration on waste stabilization lagoons was conducted at Laramie, Wyoming, a low temperature, high altitude area. Both batch and complete mixed experiments were conducted using constant air flows. Loading rates, both hydraulic and process, were varied. The supplemental aeration provided both aeration and mixing, thereby increasing metabolic rates. BOD reductions varied from 72 to 85% under three different loadings, at temperatures of less than 12C. No settleable solids were found in the effluent from the aerated system. Series operation was demonstrated to have the advantages of damping variations in quality parameters, providing for shock loading, and reducing coliform counts to minimum levels. (Author)

OPTIMIZATION OF THE REGENERATION PROCEDURE FOR GRANULAR ACTIVATED CARBON.
Water pollution control research series.
A. J. Juhola. Jul 70, 121p W72-06839 EPA17020-DAO-07/70
Contract EPA-14-12-469, EPA-14-12-107
Paper copy available from GPO $1.25 as EP2.10:17020 DAO--07/70.

Descriptors: (*Activated carbon, *Regeneration (Engineering)), (*Sewage treatment, *Activated carbon treatment), Drying, Pyrolysis, Activation, Leaching, Hydrochloric acid, Corrosion prevention, Particle size, Porosity, Ash content, Materials recovery.
Identifiers: Tertiary sewage treatment.

Laboratory scale experiments were conducted on the regeneration of activated carbons spent in tertiary treatment of wastewater. Wet spent carbon being regenerated thermally undergoes three regeneration stages: drying at about 220F; Pyrolysis of the adsorbed pollutants at 500 to 1550F; and Activation with flue gas and steam at 1600 to 1700F. Data indicated that alkaline and iron oxide ash accumulation catalyze the oxidation of carbon pores. Leaching with HCl was found to remove the metallic elements and allow regeneration to proceed with less destruction of the carbon. Other observations are discussed. (Author)

Identifiers: *Water pollution control, *Mycelium, *Fungi imperfecti, *High protein supplements, Food supplements.

A pool unit with a 2 hp surface aerator and an oxidation ditch with a 3 ft rotary brush aerator, both containing the imperfect fungus, Trichoderma viride, were compared with a conventional aerated lagoon for efficiency in treating corn and pea wastes. With pH controlled at 3.7, ammonium nitrogen and inorganic phosphate were added, and the resultant residence time in the fungal systems was 20 hours. In the fungal systems, BOD5, COD, and TOC were reduced 96%, 88%, and 93% respectively for corn wastes and 95%, 81% and 87% respectively for pea wastes. The best recovery system was a vibrating screen for bulk harvest and a sand filter for smaller particles. Cost are given including profits from selling the mycelium as feed. (Author)

PHOSPHOROUS REMOVAL BY FERROUS IRON AND LIME.

Jan 71, 78p W72-06841, EPA-WQO-11010-EGO-01/71
Water Pollution Control Research Series. Prepared in cooperation with the County of Lake, Painesville, Ohio.
Paper copy available from GPO $0.75 as EP2.10:11010EGO-01/71.

Descriptors: (*Chemical removal (Sewage treatment), *Phosphorus), (*Sewage treatment, *Precipitation (Chemistry)), (*Pickling compositions, Sewage treatment), Iron chlorides, Calcium oxides, Settling, pH control, Suspended sediments, Cost estimates, Performance evaluation, Waste disposal, Industrial wastes.
Identifiers: Liquid waste disposal, Precipitants.

Spent pickle liquor, as a source of ferric ion, was added to primary treatment facilities and found to be effective in removing more than 60% of the phosphorus contained in the sewage. When advanced means for more complete removal of the insolubilized phosphates are available, removals in excess of 90% are indicated. In addition, overall suspended solids removals averaged 61.5% and BOD and COD removals averaged 61.6 and 55.3 percent during a 23 month test period. Required iron dosage ranged from the theoretical minimum of 2.7 to a maximum of approximately 3.1 weights of ferrous iron per weight of phosphorus. The weight increase in sludge solids due to chemical precipitation of phosphorus was 100 lbs/million gallons/mg/liter of phosphorus in the influent. Total costs for treating a raw sewage containing 13 mg/l phosphorus are given. (Author)

DRY CAUSTIC PEELING OF TREE FRUIT FOR LIQUID WASTE REDUCTIONS.
Water pollution control research series,
Walter A. Mercer, Jack W. Ralls, and Harry J. Maagdenberg. Dec 70, 53p W72-06842, EPA-WQO-12060-FQE-12/70

Paper copy available from GPO $0.60 as EP2.10:12060FQE--12/71.

Descriptors: (*Fruits, *Peeling), (*Food processing, Fruits), (*Industrial wastes, Food processing), Waste water, Peaches, Pears, Quality, Biochemical oxygen demand, Water pollution, Alkalinity, Design.
Identifiers: Apricots, Dry caustic peeling, *Water pollution control.

Laboratory scale experiments in a 2 ton/hour experimental unit with peaches, pears, and apricots demonstrated that peel softened by hot solutions of sodium hydroxide can be removed efficiently by a series of rotating rubber discs. The quality of the peeled fruit prepared with the experimental unit compared favorably with fruit peeled in the conventional manner by commercial equipment, while peeling losses for all three fruits in the experimental unit were the same or slightly lower than those resulting from commercial peeling. During experimental peeling of peach halves, volume of wastewater discharged was 34.5 gallons per ton of pitted peaches as compared to 547 gallons per ton for conventional commercial peeling. AN INVESTIGATION OF TECHNIQUES FOR REMOVAL OF CYANIDE FROM ELECTROPLATING WASTES.
Water pollution control research series.

Nov 71, 94p W72-06843, EPA-WQO-12010-EIE-11/71
Grant WPRD-201-01-68
Paper copy available from GPO $1.00 as EP2.10:12010EIE-11/71.

Descriptors: (*Industrial waste treatment, *Electroplating), (*Water pollution, *Industrial wastes), (*Cyanides, Industrial wastes treatment), (*Activated carbon, Industrial waste treatment), Flotation, Zinc inorganic compounds, Vaporizing, Pilot plants, Performance evaluation, Chemical engineering, Regeneration (Engineering), Cost estimates, Capital costs, Operating costs.
Identifiers: *Water pollution control, Zinc cyanides.

Increasingly stringent stream discharge regulations have prompted an assessment of the current technology available for application to the metal finishing waste treatment problem, specifically in regard to smaller operations. Experimental laboratory and bench scale studies were then conducted on several unconventional wastewater treatment methods, including ion flotation, activated carbon adsorption, acidification volatilization, and solvent extraction. A demonstration pilot plant study was also conducted on the activated carbon process employing actual rinse waters from a zinc cyanide plating operation. The pilot scale activated carbon system was operated at 99% efficiency of cyanide removal, while providing for the complete recovery and regeneration of copper. Cost estimates for carbon sorption process are given. (Author)

ULTRATHIN MEMBRANES FOR TREATING METAL FINISHING EFFLUENTS BY REVERSE OSMOSIS,
Water pollution control research series,
Lee T. Rozelle. Nov 71, 97p W72-06844, EPA-12010-DRH-11/71
Paper copy available from GPO $1.00 as EP2.10:12010 DRH--11/71.

Descriptors: (*Industrial waste treatment, *Metal finishing), (*Water pollution, *Industrial wastes), (*Osmosis, Industrial waste treatment), (*Membranes, Osmosis), Chromic acid, Nickel, Iron, Zinc, Copper, Cellulose acetate, Sulfonic acids, Polymeric films, Cellulosic resins, Electroplating, Hydrolysis, Cyanides, Performance evaluation, Supports, Casting, Chemical engineering.
Identifiers: *Water pollution control, *Reverse osmosis, Membrane supports, Glucans.

Seventeen different reverse osmosis membranes were evaluated as to their ability to separate heavy metal ions, acids, bases, and cyanides from metal finishing wastewaters. Although no one membrane was found to be effective for all effluents, membranes of 5 different polymers showed considerable promise. Simulated acidic nickel, iron, zinc, and copper plating bath rinses were effectively treated by ultrathin membranes of cellulose acetate, cellulose methyl sulfonate, O-propyl sulfonic acid, or B-glucan acetate diaminoethyl ether. The investigations have demonstrated that ultrathin membrane separation performance can be modified by: Modifying the chemical composition; Optimizing the annealing conditions; Producing as thin a membrane as practical; and Using a polysulfone support film. Preliminary engineering considerations for reverse osmosis applications to treatment and recycle of acidic copper plating bath rinse waters are presented. (Author)

AERATED LAGOON TREATMENT OF SULFITE PULPING EFFLUENTS.
Water pollution control research series.

Dec 70, 142p W72-06845, EPA-12040-ELW-12/70
Paper copy available from GPO $1.25/copy as EP2.10:12040-ELW-12/70.

Descriptors: (*Sulfite pulping, *Industrial waste treatment), (*Spent liquors (Pulping), Industrial waste treatment), Aeration, Lagoons (Ponds), Biochemical oxygen demand, Design, Performance evaluation, Operating costs, Water pollution, Temperature, Process variables.
Identifiers: *Water pollution control.

Weak washwater from a pulp mill, evaporator condensate from the spent liquor recovery system, and paper machine white water effluents were treated over a 17 month period in a secondary treatment plant consisting of 2 aeration basins. One basin was equipped with two 75 hp aerators and the other with six 25 hp aerators. Piping was designed to permit series and parallel operation of the two basins, and provisions were made to recycle treated waste. Series operation was superior to parallel operation for the wastes treated. The two 75 hp aerators were much more efficient in both mixing and aeration capacity than the smaller 25 hp units. An 80% BOD reduction in the system was achieved at a loading of 2.2 lbs BOD/hp-hr equivalent to a daily load of 16,000 lbs BOD. Total operating costs are discussed. (Author)

MULTI-SYSTEM BIOLOGICAL TREATMENT OF BLEACHED KRAFT EFFLUENTS.
Water pollution control research series.

Dec 71, 272p W72-06846, EPA-120+0-EMY-12-71
Grant WPRD-55
Paper copy available from GPO $2.00 as EP2.10:12040 EMY--12/71.

Descriptors: (*Sulfate pulping, *Industrial waste treatment), (*Trickling filtration, Spent liquors (Pulping)), (*Spent liquors (Pulping), Industrial waste treatment), Sulfate pulps, Lagoons (Ponds), Pilot plants, Biochemical oxygen demand, Aeration, Clarification, Mathematical models, Water pollution, Performance evaluation, Process variables.
Identifiers: *Water pollution control.

Two high rate trickling filters packed with polyvinyl chloride media, an oxidation ditch with brush type aeration, and an earthen lagoon with mechanical surface aeration, were piped to allow them to be run in various combinations as multistage pilot scale treatment units for treatment of integrated kraft pulp and paper primary effluent. The combinations operated on normal strength wastewater included: Trickling filter in series (TF); TF to aerated lagoon (AL); Oxidation ditch (OD) to AL; and OD to TF. Elevation of the BOD5 from approximately 200 to 500 mg/l was accomplished by the addition of black liquor to the clarified effluent. The trickling filter with recycle performed slightly better than conventional trickling filters, reducing the BOD by 60 to 70%. 80% BOD5 removals were accomplished through short detention aerated lagoon treatment followed by clarification. Modeling of both the individual and combined treatment system was accomplished, but with only limited applicability. (Author)

POLLUTION ABATEMENT AND BY-PRODUCT RECOVERY IN SHELLFISH AND FISHERIES PROCESSING.
Water pollution control research series.

Jun 71, 82p W72-06847, EPA-12130-FJQ-06/71
Paper copy available from GPO $1.00/copy as EP2.10:12130-FJQ-06/71.

Descriptors: (*Industrial waste treatment, Food processing), (*Seafood, Industrial waste treatment), (*Water pollution, *Industrial wastes), (*Byproducts, Food processing), Alaska, Food additives, Crabs, Shellfish, Marketing, Economic analysis, Materials recovery, Fertilizers, Cost estimates, Proteins, Industrial plants, Design, Shrimps, Polysaccarides.
Identifiers: *Water pollution control, *High protein supplements, Food supplements, Chitins, Pet food, Kodiak (Alaska).

Seventy million pounds of seafood wastes, mainly from crab, salmon, and shrimp fishing, containing 22.1 million pounds of COD were discharged to Kodiak Harbor, Alaska in 1970. Aprivate firm was engaged to develop a plan to permit development of beneficial uses for the wastes while concurrently reducing the pollutional load on the harbor. The plan included collection and transportation of the waste to a central processing site on Near Island for by-product recovery. Shellfish wastes would be extracted with dilute alkali to yield a high quality protein and a chitin-calcium carbonate residue, the former to be used as pet food aditives or for industrial applications, and the latter to be exported for conversion to chitin and derived products or used in Alaska as a soil liming and fertilizer material. Fish wastes would also be extracted to yield a concentrated protein product similar to fish solubles oil and bone meal. (Author)

COMBINED TREATMENT OF MUNICIPAL KRAFT LINERBOARD AND FIBERBOARD MANUFACTURING WASTES.
Water pollution control research series.

Feb 71, 128p W72-06848, EPA-11060-DPD-02/71
Paper copy available from GPO $1.25 as EP2.10:11060DPD-02/71.

Descriptors: (*Sulfate pulping, Industrial waste treatment), (*Spent liquors (Pulping), Industrial waste treatment), (*Sewage treatment, Wood wastes), (*Wood wastes, *Industrial waste treatment), Pilot plants, Biochemical oxygen demand, Nutrients, Chlorination, Cost estimates, Capital costs, Operating costs, Feasibility, Performance evaluation, Sludge disposal, Chlorination, Design.
Identifiers: *Water pollution control, Secondary sewage treatment.

An experimental 120 gpm pilot treatment plant was used to treat a combined waste composed of mu-

nicipal sewage, wastewater from a Kraft linerboard mill and wastewater from a groundwood-cold extraction caustic insulation board mill. The pilot plant included combined and/or separate primary sedimentation units, followed by one secondary system consisting of 24 to 30 hrs of extended aeration, and one high rate plastic media trickling filter followed by 12-15 hrs of aeration. The two secondary treatment systems operated in parallel, receiving one-half of the total flow in each, and both systems had secondary sedimentation and sludge return. The pilot plant achieved in excess of 90% BOD removal, with no supplemental nutrient additions needed. Total estimated operating and capital costs for the combined treatment are given. (Author)

PHOSPHORUS REMOVAL WITH PICKLE LIQUOR IN AN ACTIVATED SLUDGE PLANT.

Mar 71, 148p W72-06850, EPA-11010-FLQ-03/71
Paper copy available from GPO $1.25 as EP2.10:11010FLQ-03/71.

Descriptors: (*Sewage treatment, Phosphorus), (*Phosphorus, *Chemical removal (Sewage treatment)), (*Pickling compositions, Chemical removal (Sewage treatment)), Activated sludge process, Iron sulfate, Precipitation (Chemistry), Feasibility, Waste disposal, Industrial wastes, Performance evaluation.
Identifiers: Precipitants, Liquid waste disposal.

Hot waste pickle liquor (ferrous sulfate) as an iron source was successful in precipitating phosphorus from solution in a 115 mgd East Plant of Milwaukee's Jones Island Activated Sludge Wastewater Treatment Plant. An 85 mgd section of the plant receiving the same influent was operated as a control. The East Plant with iron addition, achieved 91.3% removals (0.70 mg/l P effluent residual), while the control West Plant removed 83.1% (1.4 mg/l P residual). Comparison of efficiencies of purification, pH, alkalinity, and microscopic examinations of the sludge microorganism indicated that the addition of unneutralized waste pickle liquor did not adversely affect purification processes. TREATMENT OF SELECTED INTERNAL KRAFT MILL WASTES IN A COOLING TOWER.

Aug 71, 150p W72-06851, EPA-12040-EEK-08/71
Paper copy available from GPO $1.25/copy as EP2.10:12040-EEK-08/71.

Descriptors: (*Sulfate pulping, *Industrial waste treatment), (*Cooling towers, Industrial waste treatment), (*Spent liquors (Pulping), Industrial waste treatment), Industrial wastes, Industrial water, Cooling water, Aeration, Biochemical oxygen demand, Water pollution, Strippers, Process variables, Cost estimates, Capital costs, Operating costs.
Identifiers: *Water pollution control.

Cooling of pulp mill condensates, decker filtrate, turpentine decanter underflow and condenser waters from a barometric type evaporator produced the removal of 10,000 lbs BOD per day and an 8 to 10 mgd reduction in overall mill water needs for an 850 ton/day Kraft linerboard mill. The 25% to 30% BOD reduction is attributed to physical stripping of volatile components. No significant operational problems have occurred, and preliminary treatability studies have indicated that the cooling tower blowdown does not adversely affect biological treatment processes. Costs and savings are mentioned. (Author)

POTATO WASTE TREATMENT.

Jul 68, 88p W72-06852, EPA-12060-03/68
Proceedings of a Symposium Jointly Sponsored by Federal Water Pollution Control Administration and Idaho Univ., Moscow, 8 Mar 68.

Descriptors: (*Water pollution, *Industrial wastes), (*Industrial waste treatment, *Food processing), Potatoes, Anaerobic processes, Pilot plants, Irrigation, Trends, Design, Meetings.
Identifiers: *Potatoe processing, *Water pollution control, Secondary sewage treatment.

Processing of potatoes has grown markedly during the past fifteen years, especially in the Western States. Unfortunately, waste production has increased as rapidly as the processing. Several of the nation's largest fishkills have resulted, in part, from this increasing wasteload. Research is being done on treatment of potato processing wastes by various interested parties. It is for this reason that the symposium was scheduled so that existing knowledge could be shared and the gaps identified so that future research and demonstration efforts will be properly channeled. DEEP WELLS FOR INDUSTRIAL WASTE INJECTION IN THE UNITED STATES. SUMMARY OF DATA.
Water pollution control research series,
D. L. Warner. Nov 67, 48p WP-20-10 W72-06907, EPA-17070-11/67

Descriptors: (*Waste disposal, *Injection wells), (*Industrial wastes, Waste disposal), Inventories, United States, Refineries, Chemical industry, Drug industry, Metal industry.
Identifiers: *Liquid waste disposal.

The report lists 110 industrial waste injection wells located in 16 states and gives some of their characteristics. Data include operator, location, date operation was begun, well depth, injection depth, rock type and the geological age, chemical and physical character of the injected waste, injection rate and pressure, and the source of information. A statistical analysis of the well data is given in a table, and a graph shows the number of wells placed in operation from 1950 to January 1967. About 82% of the injections wells are used by chemicals, petrochemical, and pharmaceutical products plants; refineries and natural gas plants; and metal products companies. (Author)

Descriptors: (*Condensers (Liquefiers), Design criteria), (*Automobile engines, *Rankine cycle), Heat radiators, Heat transfer, Air pollution control equipment, Cooling fins, Design standards, Cost analysis.
Identifiers: Rankine cycle engines.

The goal of this study was to develop heat transfer designs or techniques that will allow construction of condensers for automobile Rankine-cycle engines that have frontal area, volume, and fan horsepower requirements which are not appreciably greater than those of present automobile radiators. The first phase of the study included a parametric study of air-side heat transfer surfaces using available heat transfer data. Plain, ring dimpled, and finned tubes as well as plain, strip, offset, louvered, wavy, and perforated plate-fin surfaces were evaluated. A perforated plate-fin gave the best analytical results when the fin thickness was changed from 0.012 in. to 0.004 in. A small test core utilizing the new perforated fin design was fabricated and tested. The performance of this core did not achieve the calculated performance. Ten more test cores were fabricated and tested with a range of perforation sizes and spacings. (Author)

AN ANALYSIS OF THE ENERGY/FUELS SUPPLY AND DEMAND SITUATION IN SELECTED AIR QUALITY CONTROL REGIONS OF THE NORTHEAST CORRIDOR.

May 71, 127p* APTD-0977

Descriptors: (*Electric power demand, *Fuel consumption), (*Fuels, *Reserves), (*Supply (Economics), Fuels), Fossil fuels, Fuel oils, Residual oils, Natural gas, Thermal power plants, Nuclear power plants, Air pollution, Abatement, Fossil fuel deposits, Coal, Economic analysis, Demand (Economics), Taxes, Sulfur.
Identifiers: *Northeast Corridor, *Air pollution abatement, *Low sulfur fuels, Air pollution economics.

The report examines the energy requirements and supplies (especially fossil fuels) needed to jointly meet both energy and air quality requirements in seven air quality control regions within the Northeast Corridor during the 1970-1975 period. The Northeast Corridor includes the east coast of the United States from Boston to Washington. This area encompasses all or at least a major part of the air quality control regions of Boston, Providence, Hartford, New York, New Jersey, Philadelphia, Baltimore, and Washington. The essential purpose of the study is to identify major gap areas in near term fuel use and projected supply requirements considering both the need for energy and the need for environmental protection. An equally important objective is to provide recommendations with respect to specific steps needed to be taken in order to fill energy gaps in an environmentally acceptable manner as revealed by the study. Descriptors: (*Atmospheric composition, Gas analysis), (*Air pollution, *Gas analysis), (*Coulometers, Gas analysis), (*Chemiluminescence, Gas analysis), (*Marine atmospheres, Gas analysis), Ozone, Oxidants, Carbon monoxide, Methane, Trace elements, Calibration.
Identifiers: *Air pollution detection.

A research experiment was conducted from Wilmington, North Carolina to the vicinity of the equator and return. Ozone, total oxidant, carbon monoxide; and methane concentrations were measured and comparative evaluation of the chemiluminescent and coulometric techniques for measuring ozone and oxidant of low atmospheric concentrations was conducted. The results suggest that both the chemiluminescent and coulometric measurement techniques will provide useful data at the low concentrations found in a relatively unpolluted marine environment. The chemiluminescent meter is more reliable than the coulometric meter under the conditions encountered. Although a precise quantitive estimate of the accuracy of the two techniques cannot be made on the basis of the data obtained, the evidence indicates that the chemiluminescent technique is significantly more accurate. Identifiers: *Thermal pollution, *Water pollution effects (Plants), *Water pollution effects (Animals), Loss of coolant accedents.

Potential environmental effects of wastes from an 1190-Mwe pressurized-water nuclear power plant, submerged 250-ft deep at four representative sites off the U.S. mainland, were studied. The thermal field of the plant's cooling water discharge, and the distribution of radionuclides in the sea, were analyzed. In every case, the thermal mixing zone (by the most stringent present standards) was found to end before either a surface or subsurface field was established, and to be much smaller than for a plant in shallower waters. The biological effects from normal radionuclides release and from that following a major accident are discussed. (Author)

BLACK-WHITE DIFFERENCES IN ANNUAL HOURS OF WORK SUPPLIED BY MALES 45--59: A PROGRESS REPT.,
Karl A. Egge. May 71, 85p DLMA-81-37-70-18-1
Contract DL-81-37-70-18

Descriptors: (*Employment, Males), (*Ethnic groups, Statistical data), Economic surveys, Manpower utilization, Productivity, Motivation, Labor relations, Statistical distributions, Earnings, Economic models, Classifications, Age, Time.
Identifiers: *Black white comparisons, *Hours of work.

A study of a sample of male wage and salary workers who were 45 to 59 years old in 1966 investigated why whites supplied about 200 more hours of labor in 1965 than blacks. It is based on data from a longitudinal study of the labor force behavior of four age-sex groups; for reports on the first two surveys for this group of men, see PB 180530 and PB 192671. The measure of hours of work included time spent searching for a job or on layoff as well as time actually employed. The model used in the investigation related hours of work to eight factors: hourly wage rate; level of nonlabor income; age; local unemployment rate; recent unemployment experience; marital status; health; and type of job, such as blue collar, etc.

Identifiers: *Air pollution episodes, *Air pollution public emergency limits, *Emergency planning, *Implementation Air Pollution Planning Program, Fairbanks (Alaska), Anchorage (Alaska).

The report presents the Emergency Episode Plan which defines contingency measures to be taken by designated agencies and state officials, in order to protect the health of persons during air pollution episodes. The plan consists of the following sections which are presented here: Legal authority; Episode Criteria, Episode Action Plan, Operational Procedures, Organizational Interfaces/Communications. From the evidence resulting from evaluation of air quality data and identification of major pollution sources, it is concluded that the threat of episodes are greatest in the follwoing three areas, at the present time: Total suspended particulates in Anchorage and Fairbanks, Carbon monoxide in Center City of Fairbanks, Oxides of sulfur in the Ketchikan Area. The Plan is designated as a mechanism for indicating public action, issuing public warning, and attempting to reduce levels of a specific pollutant concentration by reducing major source emissions. Identifiers: *Implementation Air Pollution Planning Program, *Air pollution abatement, *Air pollution sampling.

Air quality sampling instruments, if operated on a regular schedule with consistent sampling and analytical procedures, will produce data to allow long-term trends and short-term excursions in air pollutant levels to be identified. By proper location of samplers, maximal and minimal (background) concentrations can be quantified, as well as pollutant levels near centers of population, hospitals and other areas of interest. The first part of the document contains descriptions of the existing air pollution control programs in the State of Alaska, detailed discussions of the existing air quality data, and a definition of an air quality surveillance program which will meet the minimum federal requirements as defined by the Federal Register. Then described are procedures which will be used in sample collection, sample analysis, and data handling. In the State of Alaska, it is important that the air quality monitoring program define the existing problems in such detail that cause- and-effect relationships can be developed to both solve existing problems and prevent the perpetuation of problems in the future. A section address this aspect of the surveillance program. Finally a timetable for completion and resource requirements is given. (Author)

WATERCRAFT WASTE TREATMENT SYSTEM DEVELOPMENT AND DEMONSTRATION REPORT.

Sep 71, 135p W72-07099, EPA-15020-DHG-09/71
Contract EPA-14-12-522
Paper copy available from GPO $1.25 as EP2.10:15020. DHG-09/71.

Descriptors: (*Sewage treatment, *Ships), (*Coagulation, Sewage treatment), Electrochemistry, Iron inorganic compounds, Hydroxides, Coagulants, Comminution, Clarification, Activated carbon treatment, Incinerators, Performance evaluation, Field tests, Sludge disposal, Design.
Identifiers: *Shipboard sewage treatment systems, Iron hydroxides.

A shipboard sewage treatment system consisting of: Comminution of solids for ease of transport and further treatment; Electro coagulation of sewage for ease of removal of suspended solids; Solids separation; Soluble BOD reduction with carbon adsorption; Coliform bacteria removal; and Solids incineration was designed to process shipboard sanitary, culinary, and laundry wastes during prolonged sea trials. Advantages of the electrochemical system are given. Waste stream characterization showed the BOD and suspended solids levels of shipboard wastes to be 2 to 3 times the concentrations common to municipal wastes. The development program was successful in demonstrating a practical and economically viable electro-chemical treatment system. (Author)

UNDERWATER STORAGE OF COMBINED SEWER OVERFLOWS.

Sep 71, 172p W72-07100, EPA-11022-ECV-09/71
Contract EPA-14-12-143
Paper copy available from GPO $1.50 as EP1.16:11022 ECV 09/71.

Descriptors: (*Combined sewers, Overflows), (*Overflows, *Underground storage), (*Sanitary engineering, Underground storage), Storm sewers, Storage tanks, Expandable structures, Site surveys, Design, Cost estimates, Capital costs, Operating costs, Settling, Water pollution, Performance evaluation, Ohio, Great Lakes.
Identifiers: *Storm water runoff, *Water pollution control, Sandusky (Ohio), Lake Erie.

Two 100,000 gallon collapsible tanks were anchored under water in Lake Erie to demonstrate, on a pilot scale, the feasibility of storing combined sewer storm overflow in underwater flexible tanks. Site selection, model testing, system design, construction, and one year's operation were included in the investigation. During the year's operation, 988,000 gallons of storm overflow were contained and returned to the treatment plant for treatment. Construction, operation, and maintenance costs are discussed. It was determined that for larger installations, modular systems of 250,000 to 500,000 gallon basic unit tanks should be employed, with site characteristics determining both the overall feasibility of the system, and the optimum tank size should such a system be feasible. Life expectancy for tank materials can only be determined in full scale operation in the actual environment. (Author)

DEWATERING OF MINE DRAINAGE SLUDGE.

Dec 71, 92p EPA-14010-FJX-12/71, W72-07101
Paper copy available from GPO $1.00 as EP1.16:14010FJX 12/71.

Descriptors: (*Neutralizing, Mine waters), (*Mine waters, *Sludge drying), (*Water pollution, Mine waters), (*Coal mines, Mine waters), Water chemistry, Aeration, Lagoons (Ponds), pH, Thickening, Dewatering, Limestone, Precipitation (Chemistry), Thickeners (Equipment), Clarification, Settling.
Identifiers: *Mine acid drainage, Water pollution control.

Sludge formed by the neutralization of acid mine drainage is generally affected by the acid mine water composition and the method of neutralization used. The effects of both raw water chemistry and the various treatment processes on sludge composition are enumerated for each treatment process. The methods discussed include: Conventional lime neutralization; Mechanical aeration; Lagoon aeration; pH; and Sludge recirculation. Several other processes, described and studied in slightly more detail, include the High Density Sludge Process, the Densator Process, the Elpo Treatment Process, and the use of magnetic sludge. Methods of thickening, conditioning and dewatering are also presented, with vacuum filtration appearing as the most feasible. (Author)

FEASIBILITY STUDIES OF APPLICATIONS OF CATALYTIC OXIDATION IN WASTEWATER.

Nov 71, 76p W72-07103, EPA-17020-ECI-11/71
Contract EPA-14-12-572
Paper copy available from GPO $0.75 as EP1.16:1702 ECI-11/71.

Descriptors: (*Sewage treatment, *Ultrasonic radiation), (*Industrial waste treatment, Ultrasonic radiation), (*Catalysts, Ultrasonic radiation), (*Phenols, Sewage treatment), Ozonization, Oxidation, Chlorine aromatic compounds, Nitro compounds, Nickel, Coliform bacteria.
Identifiers: *Sonochemistry, Tertiary sewage treatment, Raney nickel catalysts, *Benzene/chloro-nitro, *Water pollution control, Chemical oxygen demand.

The recent discovery of the synergistic effects of certain catalysts and ultrasound (sonocatalysis) prompted research investigating the feasibility of using sonocatalysis for advanced wastewater treatment. Sonocatalytic oxidation, sonocatalytic ozonation, and catalytic ozonation were tested individually on treatment plant effluent, and mechanistic studies of sonocatalysis were conducted concurrently using synthetic wastes. Insonation, activated Raney-Nickel catalyst, and air flow produced very large removals of COD, Oxygen Demand Index (ODI), and coliforms from treated waste-waters. Synthetic wastes of phenol and orthochloronitro benzene (OCNB) were prepared and the sonocatalytic ozonation studied. (Author)

OXYGEN CONSUMPTION IN CONTINUOUS BIOLOGICAL CULTURE.

May 71, 130p W72-07104, EPA-17050-DJS-05/71
Grant EPA-WP-01023-03
Paper copy available from GPO $1.25 as EP1.16:17050DJS 05/71.

Descriptors: (*Activated sludge process, *Aeration), (*Sewage treatment, Activated sludge process), Nutrents, Respiration, Dissolved gases, Oxygen, Design criteria, Mathematical models, Mixing.
Identifiers: Chemical oxygen demand.

To aid in the further development of sewage treatment by activated sludge, a continuous flow automatically recording respirometer was used to study the response of aeration only and aeration with sludge return completely mixed activated sludge systems (CMAS) to step changes in the influent substrate. The experiments were conducted at 25 C with glucose; a mixture of glucose, glutamate, and acetate; and a mixture of sewage solids plus Metrecal. Influent substrate concentrations were doubled in the 3-hour and tripled in the 6-hour mean residence time aeration only experiments without increasing the soluble COD in the effluent. Decreases in the influent substrate concentrations produced rapid decreases in the rate of oxygen utilization. A procedure for calculating the rate of oxygen uptake by a CMAS system at any time during a step transient was developed. (Author)

FOAM SEPARATION OF ACID MINE DRAINAGE.
Water pollution control research series.

Oct 71, 61p* W72-07102, EPA-14010-FUI-10/71
Contract EPA-14-12-876

Descriptors: (*Mine waters, *Flotation), (*Water pollution, Mine waters), Additives, Frothing, Chelates, Metals, Iron, Calcium, Magnesium, Manganese, Aluminum, Surfactants, Extraction, pH control, Cost estimates, Feasibility.
Identifiers: *Froth flotation, *Water pollution control, *Mine acid drainage.

Laboratory studies of continuous flow foam separation were conducted to determine the optimum conditions for maximum extraction of dissolved metal cations (Fe, Ca, Mg, Mn, and Al) from acid mine drainage. Foaming experiments were conducted in a 6 in.-diameter glass column capable of liquid flow rates of 3-12 gal. per hour. The approach to foam separation taken was the production of the persistent foams which allowed protracted foam drainage to reduce liquid carryover in the foam. The effects of pH, chelate addition, surfactant type and concentration, air sparging rate, metal concentration and foam drainage were investigated in relation to metal extration. Results show that sewage foamability is too low for foam separation alone to be a feasible sewage treatment method. (Author)

INVESTIGATIONS CONCERNING PROBABLE IMPACT OF NITRILOTRIACETIC ACID ON GROUND WATER.
Water pollution control research series,
William J. Dunlap, Roger L. Cosby, James F. McNabb, Bert E. Bledsoe, and Marion R. Scalf.
Nov 71, 59p W72-07223, EPA-16060-GHR-11/71
Paper copy available from GPO $0.60 as EP 2.10:16060-GHR-11/71.

Descriptors: (*Water pollution, *Chelates), (*Detergents, Water pollution), (*Ground water, Water pollution), Hydrology, Sources, Chelation, Metals, Biodeterioration, Adsorption, Soil chemistry, Aquifers, Labeled substances, Tracer studies, Acetic acid, Amines.
Identifiers: *Acetic acid/nitrilo-tri.

The fate and effect of NTA both in ground waters and in soil profiles overlying ground waters were studied using laboratory models. Sorption of NTA on soils slows its movement into and through ground waters. Sorption is not sufficient to prevent or greatly reduce potential pollution of ground water by NTA used as a detergent builder. NTA infiltrating through most unsaturated soils undergoes rapid and complete degradation and contributes only inorganic nitrogen compounds and carbonate to ground waters. NTA infiltrating through saturated soils experiences only very limited degradation, with a major portion entering ground water intact. Any NTA which escaped degradation during infiltration through soils could transport such metals as iron, zinc, chromium, lead, cadmium, and mercury from soils into ground waters. NTA would degrade slowly in essentially anaerobic ground-water environments. (Author)

ECONOMIC ASPECTS OF THERMAL POLLUTION CONTROL IN THE ELECTRIC POWER INDUSTRY,
Alden G. Christianson, and Bruce A. Tichenor.
Sep 69, 16p Working Paper-67 W72-07246, FWPCA-16130-09/69

Descriptors: (*Electric power plants, *Cooling systems), (*Water pollution, Heat), Thermal power plants, Cooling water, Cost estimates, Rates (Costs), Economic analysis, Cooling towers, Lagoons (Ponds), Cost comparison.
Identifiers: *Thermal pollution, Water pollution control, *Water pollution economics, Cooling ponds.

Most new thermal power plants will use cooling devices. The economic impact of cooling, how it affects the power industry and the consumer, is discussed. Data and analyses show that the cost of providing thermal pollution control is not a restrictive factor in the production of electricity. Incremental increases in the production cost of electricity from plants with closed-cycle cooling over those with once-through fresh-water cooling are not excessive. More importantly, the impact of thermal pollution control on the consumer cost of electricity is minimal. (Author)

EVALUATION OF WASTE TREATMENT SYSTEM: CHEMAWA INDIAN SCHOOL,
B. David Clark, and Kenneth A. Dostal. Jul 68, 63p PR-6 W72-07247, FWPCA-17050-07/68

Descriptors: (*Sewage treatment, Performance evaluation), Aeration, Lagoons (Ponds), Aerators, Biochemical oxygen demand, Water analysis, Oregon.
Identifiers: Chemawa Indian School.

The Bureau of Indian Affairs (BIA) operates a nine month school for 900-1,000 Indians at Chemawa, approximately two miles north of Salem, Oregon. The waste treatment plant for the school is unique in this area, consisting of a facultative mechanically aerated lagoon followed by a two-acre polishing pond and chlorination. A sampling program was established to determine raw waste load and characteristics; solids and BOD removal in aerated lagoon; sludge accumulation in aerated lagoons; MPN level in aerated lagoons; Adequacy of aerator for mixing and oxygenation; effect of polishing pond on BOD, DO, MPN and SS; effect of chlorination on BOD, DO, MPN and SS; and operation and maintenance costs and requirements. EVALUATION OF EXTENDED AERATION TREATMENT AT RECREATION AREAS.
Progress rept.,
B. David Clark. Mar 70, 94p Working Paper-68, PR-8 W72-07248, FWPCA-15010-03/70

Descriptors: (*Recreational facilities, *Sewage treatment), Activated sludge process, pH control, Aeration, Settling, Flow rate, Design criteria, Nitrification, Mountains, Beaches, Washington (State), Oregon.
Identifiers: Denitration.

The objectives were to define basic waste characteristics from recreation areas, evaluate existing treatment processes and to develop a guide for the planning and design of wastewater treatment facilities at recreation areas. The two winter recreation areas included Timberline Lodge on Mt. Hood, approximately 50 miles east of Portland, Oregon, and Crystal Mountain Ski Area near Mt. Rainier National Park, approximately 50 miles east of Tacoma, Washington. The two summer areas included Sunset Bay State Park, also on the Oregon coast, approximately five miles north of Bandon. The problems of designing these systems is discussed. Such factors as variations in pH ad flow present design difficulties. (Author)

BASIC WASTE CHARACTERISTICS AT WINTER RECREATION AREAS.
Progress rept.,
B. David Clark. Jan 69, 88p PR-7 W72-07249, FWPCA-15010-01/69

Descriptors: (*Recreational facilities, *Sewage treatment), Design criteria, Skiing, Flow rate, Regression analysis, Washington (State), Oregon.

Findings are summarized of surveys at three winter sports areas to determine basic wastewater characteristics and recommend criteria for use in the design of treatment facilities. The tree sites selected were Crystal Mountain Ski Area near Mt. Rainier National Park, Washington, Timberline Lodge on Mt. Hood, Portland, Oregon, and Bachelor Butte Ski Area, Oregon. The quantity of various wastewater parameters discharged is a linear function of number of full-time employees, and either or both total visitors and overnight guests depending on the facilities. This relationship was vertfied by multiple linear regression analysis techniques. Statistically significant but highly variable relations were developed for COD, BOD5, suspended solids, total Kjeldahl nitrogen, and total phosphates. It is recommended that the maximum value of the 95 percent confidence limit be used in selecting design values. Methods for estimating design organic loading and design solids loading were developed. HOUSEBOAT WASTES: METHODS FOR COLLECTION AND TREATMENT,
B. D. Clark. Jun 67, 84p W72-07251, FWPCA-15020-06/67

Descriptors: (*Sewage treatment, *Boats), (*Marinas, Sewage treatment), Docks, Sanitary engineering, Collecting methods, Cost estimates, Houses, Recreational facilities, Aerobic processes, Design, Sewers.
Identifiers: *Houseboats, Shipboard sewage treatment systems, Water pollution control.

The study area included the States of Washington, Oregon, and California which have over 1200 houseboats and many other floating structures requiring sewage collection and treatment facilities. Average daily houseboat wastewater quantities are similar to those for normal land residences with a daily per capita flow of 75 gpd. Pumping all wastes to a shore sewer is the least expensive and most practical alternative wherever this is possible. Individual treatment devices including macerator-chlorinator toilets, incinerator toilets, septic tanks with soil absorption fields, and aerobic extended aeration units were considered. Costs are presented. (Author)

STATE AND MUNICIPAL NON-OCCUPATIONAL NOISE PROGRAMS.
Final rept.

31 Dec 71, 39p* EPA-NTID300.8

Descriptors: (*Noise reduction, *Government policies), Noise (Sound), Financing, Local government, State government, Research management.
Identifiers: *Noise pollution.

The document is a report on state and municipal government nonoccupational noise abatement and control programs prepared from information obtained in response to a questionnaire disseminated by the Environmental Protection Agency (EPA). They were forwarded by the EPA Administrator to the governors of each state (including Guam, Puerto Rico, the Virgin Islands) and the mayors of the 153 cities having populations, as of 1970, of 100,000 or more. The questionnaire requested information concerning the level and scope of existing and planned noise abatement and control programs. It furthermore solicited opinions on what additional support programs could be developed by the Federal government. (Author)

Great Lakes Research Inst., Erie, Pa.
EVALUATION, EXTRACTION, AND RECYCLING OF CERTAIN SOLID WASTE COMPONENTS.
Final rept.,

1972, 126p* EPA-SW-35D-72
Grant PHS-EC-00292

Descriptors: (*Waste disposal, Materials recovery), (*Refuse disposal, *Materials recovery), (*Classifiers, *Waste treatment), Waste disposal, Waste papers, Metal scrap, Glass, Ceramics, Aluminum, Tires, Copper, Plastics, Earthfills, Cost estimates, Industrial engineering, Engineering drawings, Design criteria.
Identifiers: *Waste recycling, *Solid waste disposal.

The constituents of municipal solid waste are identified along with relative weight percentages typically found. Recycling priorities are established with respect to realistic criteria. Though the study was performed for Erie, Pennsylvania, concepts may be applied elsewhere. Paper, ferrous metals, aluminum, and rubber tires are listed, in that order, with respect to desirability of extraction. Tin cans, glass, and plastics are listed next under additional criteria. A survey of current technology is presented that briefly discusses unit processes as well as complete systems under development. Many unit processes are found to be an outgrowth from mining practices. A device called the 'Bowerman Classifier' is presented and incorporated into a system with potential to separate preprocessed municipal waste. The device operates on the priaciple of Stoke's Law applied to a moving fluid. All else being held equal, settling velocity will be proportional to density and thus a separation may be effected. Identifiers: Lubbock County (Texas), Playa lakes, Water pollution detection, *Ogallala formation.

Twenty-four playa lakes in Lubbock County, Texas, were sampled on a routine basis following runoff-producing rainfall for a period of approximately eighteen months to determine whether or not recharging of water collected in these lakes might be a hazard to the quality of water contained in the underlying Ogallala aquifer. In addition, fifteen lakes lying within a triangle bounded by Plainview, Canyon, and Hereford, Texas, were sampled during the summer of 1969 to provide additional data regarding the extent of the potential problem. The quality of water in High Plains playa lakes was found to be superior to the quality of water contained in the underlying aquifer in terms of the amount of dissolved materials. The compound most commonly found in sediment samples was Dieldrin, with Aldrin being next most common, and DDT found in only a few sediment samples. (Author)

STORM WATER PROBLEMS AND CONTROL IN SANITARY SEWERS, OAKLAND AND

BERKELEY, CALIFORNIA.

Mar 71, 311p W72-07785, EPA-WQO-11024-EQG-03/71
Contract EPA-WQO-14-12-407
Paper copy available from GPO $4.00 as SN 5501-0095.

Descriptors: (*Storms, Surface water runoff), (*Sanitary sewers, *Fluid infiltration), Computerized simulation, Rainfall, Flood routing, Storm sewers, Drainage, Flood control, Cost estimates, Water pollution, Bays, California.
Identifiers: *San Francisco Bay.

An engineering investigation was conducted on storm water infiltration into sanitary sewers and associated problems in the East Bay Municipal Utility District, Special District No. 1, with assistance from the cities of Oakland and Berkeley, California. Rainfall and sewer flow data were obtained in selected study subareas that characterized the land use patterns predominant in the study area. Results obtained were extrapolated over larger drainage areas. A computerized flow routing program for the sewer system was used in this analysis. Ratios of infiltration to rainfall in the study subareas range from 0.01 to 0.14. Ratios of peak wet weather flow to average dry weather flow range from 2.1 to 9.1. (Author)

MINE SPOIL POTENTIALS FOR WATER QUALITY AND CONTROLLED EROSION.

Dec 71, 211p W72-07796, EPA-14010-EJE-12/71
Paper copy available from GPO $1.75 as EP 2.10:14010 EJE 12/71.

Descriptors: (*Coal mines, Spoil), (*Spoil, *Water reclamation), Strip mining, Acidity, Iron, pH, Pyrite, Drainage, Ion exchanging, Particle size, Lysimeters, Water pollution, Erosion, Water quality, West Virginia.
Identifiers: Preston County (West Virginia).

Analysis of exploratory test cores and rock chip samples has made available information necessary to the development of rational techniques for reclaiming coal mine spoil for useful purposes. By assigning an area a particular future use and analyzing the rock structure in advance of the surface mining, materials can be assembled and placed in the fill to allow the filled strip mine to revegetate and be developed into a useful area. Oxidation of pyrite materials, source of most acidity below 4.0 in mine spoils, can be controlled by: (1) using clay shales for fill; (2) controlling gain size in the fill; and (3) controlling accessibility to exchange of solutes and oxygen. In miniature lysimeters filled with 4 ft of normal, loamy (pH 6.7) soil, no acidity nor iron drained from the bottom from pyrite buried at 6 depths, from 1/2 to 36 inches, during a 24 week test period. Base exchange by the soil neutralized the acid and retained the iron. (Author)

ENGINEERING METHODOLOGY FOR RIVER AND STREAM REAERATION.

Oct 71, 128p W72-07797, EPA-16080-FSN-10/71

Descriptors: (*Stream pollution, *Aeration), (*Water pollution, Aeration), Water quality, Reviews, Aerators, Oxygen, Dissolved gases, Biochemical oxygen demand, Diffusers, Diffusion, Cost estimates, Site surveys.
Identifiers: *Water pollution control.

Results of recent activities in river and stream aeration by artificial techniques are reviewed, and a rational engineering methodology is developed for future river and stream aeration projects. The development of the methodology follows from a thorough review of the oxygen dynamics in rivers and streams and the capabilities of aeration systems within the present state of the art. The report shows how the theoretical work can be simplified considerably and applied to the solution of river and stream water quality problems. It is assumed that aeration would only be used as a polishing action. The results indicate that artificial aeration can be applied successfully to raise dissolved oxygen to 5 ppm, using mechanical surface aerators, diffusers, downflow contactors, and sidestream mixing. WATER BUDGET FOR THE CITY OF LARAMIE, WYOMING.
Water pollution control research series,
Paul A. Rechard. Sep 71, 34p W72-07798, EPA-17050-DVO-09/71
Paper copy available from GPO $0.50 as EP2.10:7050DVO09/71.

Descriptors: (*Wyoming, Water supply), (*Water supply, *Water pollution), Urban areas, Rivers, Sanitary engineering, Lagoons (Ponds), Industrial water, Water conservation.
Identifiers: *Laramie (Wyoming), Laramie River, Aeration ponds.

The water budget for the city of Laramie, Wyoming, was calculated for the years 1966-1970 in order to supplement studies of the city's sewage lagoons and to estimate the effects of municipal use on the Laramie River. Usage during the summer months (April-September) varied directly with temperature and inversely with rainfall, with an average of 235 gpcd. The river furnished approximately 1/3 of the annual supply, and more than 1/2 of the summer supply. On an annual basis, however the city returned more water to the river than it withdrew. (Author)

ELECTROCHEMICAL TREATMENT OF ACID MINE WATERS.
Water pollution control research series.

Feb 72, 89p W72-07799, EPA-14010-FNQ-02/72
Contract EPA-14-12-859
Paper copy available from GPO $1.00 as EP2.10:14010FNQ.

Descriptors: (*Water pollution, Mine waters), (*Mine waters, *Electrolysis), (*Iron inorganic compounds, *Oxidation), Fluidized bed processing, Electrolytic cells, Design, Cost estimates, Operating costs, Chemical reactors, Electrodes, Capital costs, Neutralizing, Limestone, Sludge disposal.
Identifiers: *Water pollution control, *Mine acid drainage, Packed bed reactors.

Synthetic acid mine drainage (AMD) water was prepared by draining tap water through waste coal, and the resulting AMD was treated on a laboratory scale by an electrolytic oxidation process. Tests of fluidized bed, packed-bed, and annular flow prototype reacotrs demonstrated the packed-bed reactor to be most efficient. Oxidation of Fe (2+) to Fe (3+) takes place on a carbon electrode at a mass transport limited rate, while hydrogen evolution occurs on a polished 316 stainless steel cathode, limited by a slower electrochemical kinetic step. Preliminary economic analyses, using a packed-bed reactor are given. The electrolytic process is free from both the safety hazards associated with radio isotope-induced oxidation and the temperature dependence of biological oxidation methods. (Author)

FEASIBILITY STUDY OF REGENERATIVE FIBERS FOR WATER POLLUTION CONTROL.
Water pollution control research series.

Oct 70, 80p W72-07800, EPA-17040-DFC-10/70
Contract EPA-14-12-815
Paper copy available from GPO $0.75 as EP2.10:17040DFC10/70.

Descriptors: (*Ion exchange resins, *Spinning (Extruding)), (*Synthetic fibers, Ion exchange resins), Sulfonic acids, Crosslinking, Polystyrene, Sulfonation, Polybutadiene, Polypropylene fibers, Regeneration (Engineering), Swelling, Epoxy resins, Cation exchanging, Anion exchanging, Feasibility, Amines, Quaternary ammonium salts, Industrial waste treatment.
Identifiers: *Melt spinning, Poly (Ethylene/sulfophenyl), Poly (Ethylene/pyridyl), Poly (Iminoethylene).

High molecular weight organic polymers co-spun with fiber-forming polymers and cross linking agents have been successfully spun into fiber and chemically treated to produce ion exchanging fibers, as opposed to the conventional beads. Styrene sulfonic acid cation exchange fibers having capacities up to 4.2 meq/gm dry fiber were prepared, using polypropylene and polybutadiene as fiber-forming polymer and cross linking agent respectively. Selectivities of fibers were similar to those of conventional beads, but different selectivities for the fibers may be possible due to anisotropic swelling of the fibers. Several other types of fibers were successfully fabricated. (Author)

AN INVESTIGATION OF DIESEL POWERED VEHICLE ODOR AND SMOKE. PART I.
Final rept.,
Karl J. Springer. Apr 67, 647p APTD-1089
Contract PH-86-66-93
Errata sheet inserted. See also Part 2, PB-207 850.

Descriptors: (*Diesel engines, *Exhaust gases), (*Smoke abatement, Diesel engines), (*Odors, Diesel engines), (*Air pollution, Exhaust gases), (*Air pollution control equipment, Diesel engines), Measurement, Odor detection, Smoke, Particles, Buses (Vehicles), Motor trucks, Field tests, Cyclic loads, Dynamometers, Simulation, Odor control, Smell, Dilution.
Identifiers: *Diesel exhaust.

Noticeable levels of diesel smoke and odor both from two-cycle powered city buses and four-cycle powered intercity trucks were investigated. Field studies, development of facilities and procedures, study of vehicle variability, and investigation of two techniques for smoke reduction were included. Results of field studies indicated that the two-cycle powered bus odor and smoke were grossly different from the four-cycle powered truck. Resonable atmospheric dilution levels from a typical horizontal bus exhaust were found. The odor measurement method involved simultaneous exposure of a panel of ten persons to a dynamically diluted sample of diesel exhaust. Utilizing various measurement methods, chassis dynamometer, panel, and smokemeter procedures were developed for the city bus and for the intercity tractor. (Author)

APPLICABILITY STUDY. COAL GASIFICATION PROCESS.
Final rept.,
L. K. Jain, and T. J. Hixson. Mar 72, 26p* APTD-1103
Contract EPA-68-02-0241

Descriptors: (*Coal gasification, Feasibility), (*Manufactured gas, Feasibility), Industrial engineering, Desulfurization, Air pollution, Design

criteria, Furnaces, Maintenance, Safety, Cost estimates, Capital costs.
Identifiers: *Air pollution abatement, *Low sulfur fuels.

The study objective was to determine the applicability of a commercial coal gasification process to electric utility and industrial boiler facilities for new installations and for the 'retrofit' of existing installations. Specific objectives were evaluation of the process with respect to cost, space limitations and operational, maintenance and safety aspects. In addition, a number of technical difficulties and unresolved problems are outlined. The use of the coal gasification process may offer potential capital cost savings, compared to existing methods of sulfur removal in the combustion of coal, markets for caking-type high sulfur coals (10,000 BTU/Lb. or less) and a method of reducing particulate emissions by converting coal to a cleaner fuel. THE POTENTIAL IMPACT OF AIRCRAFT EMISSIONS UPON AIR QUALITY,
M. Platt, R. C. Baker, E. K. Bastress, K. M. Chng, and R. D. Siegel. 29 Dec 71, 330p* NREC-1167-1 APTD-1085
Contract DI-68-02-0085

Descriptors: (*Air pollution, Exhaust gases), (*Aircraft engines, *Exhaust gases), (*Airports, Air pollution), Forecasting, Air transportation, Jet engines, Takeoff, Aircraft landing, Carbon monoxide, Nitrogen oxides, Sulfur dioxide, Particles, Lead, Hydrocarbons, Evaporation, Air pollution control equipment, Atmospheric motion.
Identifiers: *Aircraft exhaust, Jet engine exhaust, Air quality data.

The specific objectives were: to select representative airports for which detailed studies would be made of emissions and impact to determine aircraft emission factors and activity levels for the selected airports, to develop future projections of emission rates and their impact at the selected airports, and to determine emission rates and impact of unburned fuel resulting from fuel venting and other practices directly associated with aircraft operating cycles. The survey gives data on hydrocarbons, carbon monoxide, nitrogen oxides, particulates, SO2, and lead, all were in significant concentrations. Large reductions in concentrations of carbon monoxide, total hydrocarbons, nitrogen oxides, and particulates due to emissions of turbine-engine air-craft may be achieved by various control methods. However if this is not done, predictions presented show major pollution increases. (Author)

THE CHEMICAL INVESTIGATION OF RECENT LAKE SEDIMENTS FROM WISCONSIN LAKES AND THEIR INTERPRETATION.
Doctoral thesis,
Gilbert Carl Bartleson. Mar 71, 292p W72-07952, EPA-16010-EHR-03/71
Paper copy available from GPO $2.25 as EP2.10:16010HR 03/71.

Descriptors: (*Lakes, Sediments), (*Sediments, Chemical analysis), (*Limnology, *Sedimentation), Stratigraphy, Cores, Sedimentary petrology, Wisconsin, Nutrients, Nitrogen inorganic compounds, Phosphorus inorganic compounds, Calcium inorganic compounds, Carbon, Pollen, Magnesium inorganic compounds, Potassium inorganic compounds, Aluminum inorganic compounds, Iron inorganic compounds, Manganese inorganic compounds, Theses.
Identifiers: Lake Mendota (Wisconsin), Madison lakes (Wisconsin), *Eutrophication.

To trace the effects of cultural eutrophication, one meter sediment cores were used to determine the history of calcareous and noncalcareous Wisconsin lakes. Cores were analyzed for carbon, phosphorus, calcium, magnesium, potassium, aluminum, iron, and manganese. Determinations of organic nitrogen, exchangeable ammonium and acid soluble phosphorus were made on selected sedimentary profiles. Recent sedimentation rates and identification of pre- and postcultural sediments were determined by ragweed pollen. Enrichment of phosphorus in postcultural Lake Mendota, Wisconsin, sediments are the effect of increased phosphorus supply from domestic sewage. Chemical stratigraphy of concentration-depth diagrams permit a qualitative evaluation of cultural activities. Potentialities and limitations of using recent lake sediments to evaluate eutrophication are discussed. (Author)

Descriptors: (*Salmon, *Water pollution), (*Fishes, Water pollution), Aquatic biology, Ecology, Oxygen, Oxygen consumption, Physiology, Respiration, Swimming, Lipid metabolism, Hematology, Animal behavior, Animal migrations.
Identifiers: *Water pollution effects (Animals).

A floating laboratory was built for conducting multiparameter physiological studies on salmon in marine, estuarine, and fresh waters. New methods were developed using a swimming chamber-respirometer for adult salmon. Normal values were measured for a variety of physiological functions, then repeated on salmon migrating through an urban estuary charachterized by sewage pollution and low DO. Effects seen included decreased swimming stamina and respiratory efficiency, decreased oxygen consumption and increased lactate, decreased urine flow and ammonia excretion, especially in the presence of environmental ammonia. Longer term disruptions in hematology and lipid metabolism were seen. Most of the effects occurred at DO concentrations just below 5 mg/liter, except for synergistic effects between ammonia and low DO at somewhat higher concentrations. (Author)

Descriptors: (*Water pollution, *Inorganic compounds), (*Toxicology, Water pollution), Tables (Data), Reviews, Concentration (Composition), Carcinogens, Mutagens, Lethal dosage, Sources, Industrial wastes, Metals, Transition metals, Halogens, Sulfur inorganic compounds, Phosphorus inorganic compounds, Nitrogen inorganic compounds.
Identifiers: Water pollution effects (Animals), Water pollution effects (Plants).

A survey of the literature dealing with inorganic chemical compounds was conducted to obtain and reference data relevant to the establishment of water quality criteria. More than 5,000 publications were reviewed. While nearly 300 inorganic species may exist in freshwater only 87 were identified in the literature. A wide distribution in concentrations in potable and polluted water was found. Data on acute toxicity, chronic toxicity, carcinogenicity, mutagenicity, and teratogenicity of inorganic chemicals have been tabulated. Because of the design of most of these toxicological determinations, it is difficult to extrapolate from this data to human health. Correlations have been made of minimum lethal oral dose versus maximum concentrations reported in freshwater, and of minimum chronic toxic dose versus maximum concentration reported in drinking water. Examples of inorganic species which approach a safety limit have been observed. (Author)

Identifiers: *Storm water runoff, *Sacramento (California).

Necessary data are not available in most areas to determine or predict distributions of storm water runoff and combined sewage flows and pollutant concentrations. To alleviate this problem, a procedure was developed to permit rapid, economical, and accurate assessments of system performance based on 3 different and important water quality criteria. The first criterion establishes an absolute maximum pollutant concentration which cannot be exceeded. The second

criterion establishes an acceptable distribution of pollutant concentration by specifying the greatest frequency of occurrence for a particular concentration value. The third criterion establishes the maximum acceptable excession frequency for a particular pollutant frequency. A computer model was then used with a modified rational runoff method to perform preliminary design tasks and weigh alternatives to the designs. Then the least costly system developed for the Sacramento, California area as an example. (Author)

GRU.1GM.71 APTD-1069
Contract EPA-EHSD-71-13

Descriptors: (*Sulfur, *Demand (Economics)), (*Economic forecasting, Sulfur), (*Supply (Economics), Sulfur), Byproducts, Utilization, Mathematic models, Prices, International trade, Air pollution, Abatement, Computer programs, Trends, Sulfuric acid, Coal preparation, Coal gasification, Stockpiling.
Identifiers: Waste gas recovery, Air pollution economics.

Sulfur demand, supply and price are projected to the year 2020. The projections are for use in establishing R and D priorities for recovery of abatement sulfur in marketable and non-marketable forms. The projections are made via a computer model, and permit estimation of the value of abatement sulfur at various times during the forecast period and for various sources and/or quantities of sulfur recovered in useful forms. The model includes the simulation of different abatement schedules and also of additional demand such as might be created by a national stockpile of elemental sulfur. The factors affecting the relative value of sulfur in acid and elemental form are analyzed. The foreign situation is also considered because of its impact on domestic supply/demand/price relationships. The future supply of sulfur will depend increasingly on recovery from fossil fuels. Identifiers: *Air pollution control, Venturi scrubbers, Limestone scrubbing.

Control of sulfur dioxide emission from a coal-fired power generating boiler using a cocurrent venturi-type scrubber in series with a wetted film packed tower was studied in a one-thousand cfm pilot system. Sulfur dioxide absorption characteristics were studied in detail with three types of alkali materials, calcium oxide, sodium carbonate and calcium carbonate. Sulfates lime/fly ash and dolomitic lime were also tested and their absorption properties were compared to the calcium oxide results. The primary objectives were the development of design data for predicting sulfur dioxide absorption in a venturi scrubber with limestone-injection wet scrubbing and a combination of a venturi scrubber and packed tower with direct lime/limestone wet scrubbing. A simplified method for expressing the SO2 absorption was developed with standard linear correlation techniques. Process parameters relevant to the type of absorption device were studied so that the SO2 absorption efficiency could be estimated for similar operating systems. (Author)

Identifiers: Feedlot wastes, Eutrophication, Manure, *Water pollution control, Solid waste disposal.

Twelve typical agricultural areas representing three types of animal waste management techniques--lagooning, direct discharge into streams, and land spreading including pasture and drylot units--were studied to determine the amounts of and factors governing stream pollution from swine, dairy, beef, and poultry production operations. More than 1500 stream and lagoon effluent samples were collected with an automatic sampler developed for the study. The samples were analyzed for bacteria, nutrients, and degradable organics. Hydrological and waste management data were also collected. Study results point to the superiority of land spreading for the disposal of animal wastes. (Author)

CHARACTERISTICS OF WASTES FROM SOUTHWESTERN CATTLE FEEDLOTS.
Water pollution control research series.

Jan 71, 91p W72-08299, EPA-WQO-13040-DEM-01/71
Paper copy available from GPO $1.00 as EP2.10:13040DEM01/71.

Descriptors: (*Beef cattle, Agricultural wastes), (*Surface water runoff, Water pollution), (*Water pollution, Agricultural wastes), (*Waste disposal, *Agricultural wastes), Utilization, Lagoons (Ponds), Fertilizers, Hydrology, Nutrients, Anaerobic processes.
Identifiers: *Feedlot wastes, Solid waste disposal, Manure, *Water pollution control.

Research was conducted on experimental feedlots in Lubbock, Texas, to determine the characteristics of wastes from Southwestern cattle feedlots. The feedlots were generally operated in a manner conforming to normal commercial practice in the area. They were provided with collection pits that allowed the quantity of runoff to be measured accurately. Samples of runoff were collected routinely both during rainstorms and from the collection pits. Manure samples were also collected routinely for analysis. The quantity of runoff per unit area of concrete-surfaced lots is substantially greater than the quantity per unit area of dirt-surfaced lots. Concentrations of pollutants in

concrete-lot runoff are substantially higher than corresponding concentrations in runoff from dirt-surfaced lots. Agronomic studies indicate that runoff can be used for irrigation of crops, but extreme caution is required in the application of runoff to crops to prevent damage to them. (Author)

STUDY OF THE FUTURE SUPPLY OF LOW SULFUR OIL FOR ELECTRICAL UTILITIES.

Feb 72, 76p* HIT-499 APTD-1078
Contract EPA-EHSD-71-43

Descriptors: (*Electric power generation, Air pollution), (*Fuel oil, *Economic forecasting), (*Residual oils, Economic forecasting), (*Fuels, Electric power generation), Bunker oils, Fuel consumption, Sulfur, Trends, Public utilities, International trade, Supply (Economics), Demand (Economics), Air pollution, Abatement, Desulfurization.
Identifiers: *Low sulfur fuels, Air pollution abatement, Imports.

The report examines the future supply and demand of low sulfur fuel oil. Of all the fuels, residual oil (resid, No. 6, or 'Bunker C') was the most difficult to study. The currently available predictions on the supply and demand for electricity and fuels were collected and studied. Construction plans of the utilities were obtained. Data on United States and foreign production of residual oil were gathered including the availability of low sulfur fuel. Total demand for residual fuel was predicted along with the demand for low sulfur fuels. The potential supply of low sulfur fuels was predicted. The effects that import regulations have on this supply was studied. The costs of direct desulfurization of resid were estimated along with the costs of oil transportation. The supply and demand quantities for residual oil were compared for the 1970-1980 time period and conclusions were drawn as to what steps must be taken to satisfy the 1980 demand for low sulfur fuels. (Author)

THE ECONOMIC EFFECTIVENESS OF MANDATORY ENGINE MAINTENANCE FOR REDUCING VEHICLE EXHAUST EMISSIONS.
Interim rept.

Jan 72, 93p* APTD-1072
Contract CPA-22-69-087
Prepared in cooperation with Scott Research Labs., Inc., San Bernardino, Calif.

Descriptors: (*Automobiles, Inspection), (*Air pollution, Exhaust gases), (*Automobile engines, *Exhaust gases), Feasibility studies, Maintenance, Economic analysis, Cost estimates, Mathematical models, Gas sampling, Optimization, Carbon monoxide, Hydrocarbons, Statistical analysis, Nitrogen oxides.
Identifiers: *Motor vehicle inspection, *Automobile exhaust, Air pollution abatement.

An investigation was made of the feasibility of controlling exhaust emissions through a program of mandatory vehicle inspection and maintenance. Exhaust emission quantities, i.e., levels and reductions, were estimated based on a constant volume sampling (CVS) procedure. The most cost-effective inspection interval is approximately yearly regardless of the inspection/maintenance procedures applied. Inspection procedures performed in a state lane using the measurement of emission levels under load are generally more cost-effective than those performed in franchised garages using conventional diagnostic instruments, but produce smaller emission reductions. A statistical analysis of the emission reductions for the baseline and test fleets has revealed that the predicted differences in mean emission levels is significant at greater than the 90 percent level of confidence. Emission reductions are most sensitive to the inspection approach used to reject vehicles and to the extent of the imposed maintenance. (Author)

Descriptors: (*Air pollution, Sulfur dioxide), (*Flue gases, *Sulfur dioxide), Chemical reactions, Reaction kinetics, Plumes, Coal, Fuel oil, Sulfur, Fly ash, Humidity, Plumes, Chimneys, Temperature, Simulation, Electric power plants, Particles.

The purpose was to simulate on a laboratory scale the time-temperature profile of a central-station power plant and the early plume. A multipurpose furnace fired either with pulverized coal or with residual oil; a simulated boiler/economizer section; an electrostatic precipitator for use with coal firing; a stack section, in which temperature distribution was controlled independently by electrical heating; and a dilution and expansion chamber to simulate the early stages of plume development were used. The objectives were: Identification of sections of the system wherein major depletion in SO2 could be observed; Determination of the effect of fuel type on SO2 depletion; Determination of the significance of the contribution of fly ash to the overall SO2 depletion; investigation of the rate of oxidation of SO2 in the early stages of plume development; and Assessment of the effects of relative humidity, temperature, and process variables on the rate of SO2 loss in the early plume. First-order rate constants for the decay of SO2 in the plume agreed with those found by other investigators. (Author)

ELECTRICAL POWER SUPPLY AND DEMAND FORECASTS FOR THE UNITED STATES THROUGH 2050.
Feb 72, 57p HIT-498 APTD-1079
Contract EPA-EHSD-71-43

Descriptors: (*Electric power generation, Forecasting), Electric power, Utilization, Trends, Electric power plants, Requirements, Fuels, Economic analysis, Air pollution.

The historical growth of the demand for electrical power, the trends in selection of power plant fuels by geographic distribution, projections of power demand growth into the twenty-first century, and the potential impacts on national air quality resulting from the various alternatives of fuel usage are explored. In particular, power plants scheduled for construction from mid-1971 onward are surveyed to provide a basis for estimating the impact of national emission standards for sulfur dioxide on the electrical generating industry. Total installed power capacity will increase from about 320,000 megawatts in 1970 to about 1,000,000 megawatts in 1990, about 1,500,000 in 2000, and 5,200,000 in 2050. Fossil fuels supply about 83 percent of utility power in 1970. Fossil fuel use will decrease to about 50 percent in 2000 and to about 11 percent in 2050, while nuclear power will increase from the present 3 percent to about 45 percent in 2000 and to about 88 percent in 2050. Identifiers: *Solid waste disposal, Air pollution abatement, Low sulfur fuels.

The fuel properties of refuse and the mechanics and combustion technology associated with the utilization of refuse as a fuel in generating utility grade steam were systematically assessed. By estimating the inventories and compositions of refuse that would likely occur, the extent of SO2-abatement that might be realized in using refuse as a partial coal substitute was projected through the year 2000. Ten different combined-fuel (coal + refuse) fired boiler configurations were conceived and then analyzed in terms of process variables (plant power capacity, fuel-ratio, etc.); performance/cost characteristics were also predicted. Similarly treated were five plans for modifying existing plants to refuse-burning systems. At least one of the systems within the first group was identified as being a more cost-effective approach to refuse disposal than is landfill. The cost model was developed to consider all the major elements involved in the erection and operation of the candidate refuse-burning systems. Two new-plant configurations were extracted and subjected to detailed engineering analysis. Cost estimates were iteratively computed for the resulting preliminary designs. (Author)

MODELING, ANALYSIS, AND EVALUATION OF RANKINE CYCLE PROPULSION SYSTEMS. VOLUME I. FINAL REPORT,
J. H. Skinner, R. P. Shah, and W. A. Boothe. Feb 72, 181p* S-71-1129-1 APTD-0960
Contract EPA-EHS-70-111
See also Volume 2, PB-209 278.

Descriptors: (*Automobile engines, *Rankine cycle), Digital simulation, Steam engines, Steam turbines, Combustion, Boilers, Heat transfer, Cyclic loads, Air pollution.

The objective was to develop a generalized computer model of a Rankine-cycle automotive propulsion system to be used for the analysis of propulsion system dynamics. Digital computer models were developed for the following propulsion system components: working fluid--water and organic; combustor; vapor generator; expander--reciprocating and turbine; condenser; regenerator; feedpump; and controls. Other vehicle system models which were developed to permit analysis of engine dynamics during realistic driving transients include: transmission; vehicle motion; route mission profiles; and driver. A module-linkage approach was employed. Linkage of the information signals forms a total system model which can be employed for transient analysis of the entire propulsion system. The derivation of the models and their application to specific designs are included. Steady-state and transient results are presented.

EPA-EHS-70-111
See also Volume 1, PB-209 277.

Descriptors: (*Automobile engines, *Rankine cycle), (*Computer programs, Manuals), Digital simulation, FORTRAN.

Computer program listings for the models derived and analyzed in Volume 1, PB-209 277, are presented. FORTRAN nomenclature, flow diagrams, input and output information, and other user instructions are also included. The manual has been prepared so that the user can link the programs together to form a component or system model, provide the needed input, run the program, and obtain and interpret the results. Each section deals with a particular model. All of the subroutines that are employed in constructing the model are listed. The total memory size requirements for all programs used in the total systems model is approximately 45K. The sections are: fluid property models; reciprocating expander model; turbine expander model; feedpump model; vapor generator model; condenser model; regenerator model; combustor model; transmission model; driver model; parametric design programs; and total system model. SURVEY OF NUCLEAR POWER SUPPLY PROSPECTS.
Feb 72, 99p* HIT-501 APTD-1077
EPA-EHSD-71-43

Descriptors: (*Nuclear electric power generation, Forecasting), Reviews, Trends, Air pollution, Abatement, Converter reactors, Breeder reactors, Nuclear fusion, Cost estimates, Nuclear fuels, Reserves, Thermal power plants.
Identifiers: Air pollution abatement, Light water reactors.

A detailed review of the nuclear segment of the power industry and an evaluation of the ways in which nuclear power will impact on national air quality and emissions from fossil-fueled steam electric plants are presented. Electrical power from nuclear-fueled reactors will continue to grow at a substantial rate and will ultimately supply a major portion of electrical power in the United States. The development and use of nuclear plants will directly affect the use of fossil fuels to supply electrical power and will also directly affect the amounts of combustion products released to the environment. The forecast of future power supplied by nuclear reactors has been shown by optimization analysis to be strongly dependent upon the reactor types and their technological development. Fossil-fueled generating plants will continue to produce power at levels equal to or greater than 1970 levels for the next 80 years. (Author)

STUDY OF THE FUTURE SUPPLY OF NATURAL GAS FOR ELECTRICAL UTILITIES.

Feb 72, 44p* HIT-500 APTD-1080
EPA-EHSD-71-43

Descriptors: (*Natural gas, Forecasting), (*Fuels, Forecasting), (*Fuel consumption, Natural gas), Utilization, Supply (Economics), Demand (Economics), Liquefied natural gas, Substitutes, International trade, Coal gasification, Oil shale, Manufactured gas, Petroleum, Gas production, Gas reservoirs, Electric power generation, Cost estimates, Reserves, Air pollution, Abatement, Trends.
Identifiers: *Low sulfur fuels, Imports.

The availability of natural gas as a low sulfur fuel for electrical production was examined in light of historical usage and availability. The goal was to ascertain not only near term but extended demands. Projections were made out through the year 2000. Such alternates as coal and oil shale gasification, Liquid Natural Gas (LNG), and well stimulation were evaluated. It represents a very clean fuel and, as a result, a fuel which can become an important control in the fight against pollution. (Author)

ADVANCED AUTOMOTIVE POWER SYSTEM STRUCTURED VALUE ANALYSIS MODEL,
J. Dukowicz, W. Fraize, E. Keitz, S. Poh, and J. Stone. Oct 71, 284p* MTR-6085 APTD-0966
Contract F19628-71-C-0002

Descriptors: (*Automobile engines, Evaluation), (*Air pollution, Exhaust gases), (*Exhaust gases, Automobile engines), Mathematical models, Computer programs, Assessments, Design criteria, Cost estimates, Acceptability, Performance evaluation, Economic analysis, Safety, Maintenance, carbon dioxide, Hydrocarbons, Nitrogen oxides, Air pollution control equipment.
Identifiers: Computer aided analysis.

A model which will provide a tool in evaluating advanced low-emission automotive power systems, and a basis for decisions relating to further development of candidate power systems is presented. The technique is quantitative and readily adaptable to the stage of a candidate's development. It relies primarily on engineering measurements and provides consistent repeatable results. It allows the use of expert value judgments as a valid part of the evaluation process. The parameters which, when measured, will provide the information needed to describe and adequately evaluate the candidate are listed, and the measurement scales and the rationale for the parameter selection are provided.. The cost and economic factors critical to the evaluation of candidates are discussed. The analytical formulation of the model is addressed. Also included are value sets of parameters for eight evaluation categories: emissions, operating performance, acceptability, operating environment, safety, personnel and facilities, propulsion system technology and reliability and maintenance. A LOCALIZED STUDY OF GRAY IRON FOUNDRIES TO DETERMINE BUSINESS AND TECHNICAL COMMONALITIES CONDUCTIVE TO REDUCING ABATEMENT COSTS.

Jan 72, 191p* APTD-1081
Contract EPA-68-04-0043

Descriptors: (*Iron and steel industry, *Air pollution control equipment), (*Air pollution, *Industrial wastes), Foundries, Interest groups, Regulations, Cost estimates, Capital costs, Operating costs, Process variables, Financing, Taxes, Reverberatory furnaces, Scrubbers, Government policies, Particles, Furnance cupolas, Gas filters, Design criteria.
Identifiers: *Air pollution control, *Air pollution economics.

The thesis was that economies of scale both in purchase and in financing costs might be available to the grey iron foundries for air pollution control equipment, thereby lessening the financial impact in complying with air pollution regulations. This group buying-financing management technique was not known to have been applied to procurement and financing of air pollution abatement devices in any industry. The salient attributes of such an organization were surveyed. The various regulations in the geographical area of concern were examined to establish a tentative grouping of foundries by degree of control needed. Foundry operating procedures and cupola design factors that could affect cupola emissions were evaluated. Performance-cost tradeoff factors were studied, including a possible process change. Quotations were obtained for reverberatory furnace process replacement, and for a venturi scrubber as a function of quantity. Various financing alternatives were explored.

LARGE POWER PLANT EFFLUENT STUDY (LAPPES). VOLUME III. INSTRUMENTATION, PROCEDURES, AND DATA TABULATIONS (1970),
Francis A. Schiermeier. Jan 72, 305p APTD-0735
See also Volume 2, PB-202 220.

Descriptors: (*Air pollution, *Combustion products), (*Electric power plants, Air pollution), Plumes, Sulfur dioxide, Tables (Data), Meteorological data, Topography, Climatology, Monitors, Thermal power plants, Meteorological instruments, Pennsylvania.
Identifiers: *LAPPES (Large Power Plant Effluent Study), Indiana County (Pennsylvania).

The Large Power Plant Effluent Study (LAPPES) was initiated during 1967 in Western Pennsylvania to evaluate the extent and effects of air pollution resulting from the largest complex of coal-burning generating stations in the United States. Two series of LAPPES field experiments were conducted in an area surrounding Homer City and Conemaugh Generating Stations; these experiments consisted of ground-based and airborne plume measurements supported by extensive meteorological observations. The report describes the topography and climatology of the generating station complex, the sulfur dioxide and meteorological monitoring equipment, and experimental procedures. Also presented are tabulations of plant operational parameters and the air quality and meteorological data collected. (Author)

A STUDY OF THE INFLUENCE OF FUEL ATOMIZATION VAPORIZATION, AND MIXING PROCESSES ON POLLUTANT EMISSIONS FROM MOTOR-VEHICLE POWERPLANTS.
Rept. on Phase 2,
D. A. Trayser, J. A. Gieseke, R. D. Fischer, and F. A. Creswick. 31 Jan 72, 134p* APTD-0964
Contract EPA-CPA-70-20
See also report dated 30 Apr 69, PB-185 886.

Descriptors: (*Automobile engines, *Carburetion), (*Air pollution control equipment, Automobile engines), (*Carburetion, *Vaporizing), Spark ignition engines, Design, Atomizing, Fuel injectors, Intake systems, Impingement, Manifolds, Drops (Liquids), Evaporation, Flow rate, Samplers, Exhaust gases.
Identifiers: Air pollution control.

The objectives of the experimental program were to obtain experimental data on droplet impaction characteristics, fuel-film flow on manifold walls, and fuel vaporization for a better understanding of induction-system phenomena; and to demonstrate the potential of improved fuel atomization, fuel vaporization, and intake manifold design for improving air-fuel mixing and distribution. Ultrafine atomization, minimum manifold-passage turning angle, long passage bend radii, and low air velocity can reduce droplet impaction in an induction system. However, appreciable droplet impaction still occurs, even with droplet sizes as low as 14 microns, because of deposition by flow-induced air turbulence. Consequently, fuel vaporization by intake air preheating and by manifold surface heating is recommended in addition to improved atomization to reduce further the fuel film on the wall. An improved induction-system design concept is described. (Author)

LASER HOLOGRAPHY STUDY OF OIL-FIRED BURNER COMBUSTION,
A. B. Witte, and B. J. Matthews. Nov 71, 61p*
14103-6004-RO-00 APTD-1088
Contract EPA-CPA-70-4

Descriptors: (*Oil burners, Flames), (*Flames, *Holography), Air pollution, Turbulence, Feasibility, Interferometers, Temperature measurement, Combustion products, Nitrogen oxide (NO), Data reduction.
Identifiers: *Interferometric holography.

The research objective was to design instrumentation and evaluate its feasibility for characterizing flame turbulence and temperature gradient for several burner configurations. In this way, it may be possible to relate basic flame characteristics to the generation of emissions, particularly NO which is formed and fixed in the primary combustion zone. The feasibility of recording fog-free holographic interferagrams of residential fuel fired oil burner flames was demonstrated with two holocameras designed to observe the near and far field of the burner. The most important feature observed interferometrically was that the flame structure is extremely turbulent. This turbulence made it impossible to resolve the fringe pattern on the centerline of the burner. Barewire thermocouple measurements made of the flame were corrected for radiation. Excellent quality holographic interferograms were recorded of a small burner (Bernzomatic burner). Recording a holographic interferogram of a hot air gun showed the feasibility of controlling the turbulence level of a flame-like hot gas. Preliminary data were also reduced in this case. (Author)

TECHNICAL AND ECONOMIC FACTORS ASSOCIATED WITH FLY ASH UTILIZATION.
Final rept.

26 Jul 71, 271p* TOR-0059 (6781)-1 APTD-1068
Contract F04701-70-C-0059

Descriptors: (*Fly ash, Utilization), (*Waste disposal, Fly ash), Aggregates, Fillers, Reviews, Soil aggregates, Bricks, Concrete durability, Limestone, Bituminous concretes, Lightweight aggregates, Portland cements, Concretes, Marketing, Cellular concretes.
Identifiers: *Solid waste disposal.

The objectives were to investigate the current and potential uses of regular fly ash and to: Identify the factors which inhibit its use, Investigate the applicability of substituting wet-limestone-modified fly ash in the regular fly ash market, and Make recommendations for developing both the regular and wet-limestone-modified fly ash markets. The results are presented. The study was directed toward fly ash produced by the coal burning power utilities. This constitutes the major portion of fly ash produced in this country and is the source of ash collected and sometimes used as a raw material for various products or applications. Presently, of the 26.5 million tons produced annually, approximately 1.6 to 2 million tons are utilized. (Author)

COMPILATION OF AIR POLLUTANT EMISSION FACTORS, (REVISED).

Feb 72, 164p* AP-42
Supersedes PB-190 245. Paper copy also available from SOD as EP4.9:42.

Descriptors: (*Air pollution, *Industrial wastes), (*Transportation, Air pollution), (*Chemical industry, Air pollution), (*Food processing, Air pollution), (*Metal industry, Air pollution), (*Petroleum industry, Air pollution), (*Paper industry, Air pollution), (*Waste disposal, Air pollution), Combustion rate, Concentration (Composition), Exhaust gases, Combustion products, Coal, Fuel oil, Incinerators, Dry cleaning, Gasoline, Organic solvents, Cements, Ceramic materials, Evaporation, Sources.
Identifiers: *Solid waste disposal, *Cement industry.

Emission data obtained from source tests, material balance studies, engineering estimates, etc., have been compiled for use by individuals and groups responsible for conducting air pollution emission inventories. Emission factors given in this document, the result of the expansion and continuation of earlier work, cover most of the common emission categories: fuel combustion by stationary and mobile sources; combustion of solid wastes; evaporation of fuels, solvents, and other volatile substances; various industrial processes; and miscellaneous sources. When no source-test data are available, these factors can be used to estimate the quantities of primary pollutants (particulates, CO, SO2, NOx, and hydrocarbons) being released from a source or source group. Identifiers: *Air pollution control.

An investigation into chemical methods for treatment of foul air was conducted by the City of San Diego. A pilot liquid-gas contactor was constructed of PVC lining and stainless steel shafting. Several oxidizing and absorptive chemicals (tap water, sodium hydroxide, calcium hypochlorite, potassium permanganate, copper sulfate, copper chelate, etc.) as well as biologically active materials, were used in the contractor to remove the foul odors in air vented from the sewage sedimentation tanks. Under the experimental sulfide levels of 1.0 to 20.0 ppm H2S (by weight in the gas) good removal was shown by commercial sodium hydroxide, gaseous chlorine and ammoniated copper chelate. Ozone, when used in conjunction with other reactive chemicals, helped in removal of odors other than H2S, as well as H2S. Approximate costs (chemicals only) for treating 1,000,000 cubic feet (28,318.5 cubic meters) of foul air are given. (Author)

THE RELATIONSHIP BETWEEN LAND USE AND ENVIRONMENTAL PROTECTION,
E. J. Croke, K. G. Croke, A. S. Kennedy, and L. J. Hoover. 31 Mar 72, 56p* APTD-1105
Presented at Joint Meeting of the President's Water Pollution Control Advisory Board and Air Quality Advisory Board, March 27-31, 1972.

Descriptors: (*Land use zoning, *Pollution), (*Air pollution, Land use zoning), (*Water pollution, Land use zoning), Land development, Environmental surveys, Abatement, Regulations, Law (Jurisprudence), Regional planning, Urban planning, State government, National government, Government policies, Trends, Waste disposal.
Identifiers: Air pollution abatement, Water pollution abatement, Solid waste disposal.

The case is outlined for integrating land-use planning and regulation with environmental protection. The document indicates some of the legal, institutional, organizational, and technical aspects of this approach to the preservation of environmental quality. There is a growing recognition of the need to subject public and private decisions regarding land use to a much closer scrutiny with regard to their environmental implications. An array of evaluative techniques now used either for land-use planning or for environamental planning may be of potential use in formulating environmental land use policies. If land use guidance and environmental protection objectives are to be integrated, programs for merging the procedures and practices of groups involved in these functions must be developed. (Author)

CHEMILUMINESCENT OZONE MEASUREMENT PROGRAM--OZONE TOTAL OXIDANT RELATIONSHIP IN AMBIENT AIR.
Final rept.,
Harold G. Richter, James R. Smith, and Lyman A. Ripperton. May 69, 84p APTD-1087
Contract PH-22-68-30
See also report dated Jan 71, PB-198 065.

Descriptors: (*Ozone, *Gas detectors), (*Air pollution, Ozone), Comparison, Chemiluminescence, Colorimetric analysis, Coulometers, Urban areas, Diurnal variations.
Identifiers: *Air pollution detection.

Ozone and total oxidant in ambient air were measured simultaneously for a two month period in Philadelphia and a similar period in Denver, Colorado. Ozone was measured by the chemiluminescent technique and total oxidant by both colorimetric and coulometric techniques. The object was to compare these methods. The ozone and total oxidant instruments were calibrated by a constant ozone source (standardized by the neutral KI analytical technique) at the beginning and end of each experimental period. The chemiluminescent instrument operated satisfactorily more than 97% of the time, but the colorimetric total oxidant instruments operated satisfactorily less than 50% of the time. It is thus not possible to calculate ozone concentrations in urban air from measured total oxidant concentrations with any degree of confidence. The chemiluminescent ozone measurement is more specific and less subject to interference than the colorimetric or coulometric 'total oxidant' measurement. (Author)

VEHICLE EMISSIONS SURVEILLANCE STUDY.

20 Aug 71, 180p APTD-1076
Contract CPA-22-69-087
Prepared in cooperation with Scott Research Labs., Inc., San Bernardino, Calif.

Descriptors: (*Air pollution, Exhaust gases), (*Automobile engines, *Exhaust gases), Sampling, Field tests, Temperature control, Mathematical models, Simulation, Test facilities, Manuals, Confidence level, Hydrocarbons, Carbon monoxide, Cost estimates, Project planning.
Identifiers: *Automobile exhaust, Motor vehicle inspection.

The objective was to recommend optimal procedures for conducting an automobile exhaust emissions field surveillance program. The primary objective of this field surveillance program is to characterize vehicular emissions to the atmosphere for specific regions within the United States. Alternatively, the data may be used to evaluate regional differences in vehicular emissions such as might occur because of different vehicle maintenance policies. General surveillance program guidelines were developed but were not amenable to mathematical modeling because of complexity and/or lack of definitive data. Specific procedures and equipment configurations were optimized using the surveillance system model. (Author)

Descriptors: (*Hydrology, Irrigation), (*Irrigation, *Water pollution), Surface water runoff, Ground water recharge, Project planning, Government policies, Leaching, Agricultural wastes, Fertilizers, Nutrients, Rivers, Research.
Identifiers: *Water pollution control.

The status of the National Irrigation Return Flow Research and Development Program is presented. Current research projects and future program development are discussed. The report represents the position of the Environmental Protection Agency (EPA) with regard to the development of effective controls on the quality of irrigation return flows. Program goals and milestones are outlined. A number of potential control measures are discussed. Improvements in the water delivery system, on-the-farm water management, and the water removal system are considered with respect to improving the quality of irrigation return flows and decreasing the degradation of receiving waters. Research and investigations are needed to evaluate the effectiveness of potential control measures. Demonstrations and educational activities will be required to overcome institutional, political, and legal constraints to water management reform. (Author)

MANAGEMENT OF NUTRIENTS ON AGRICULTURAL LAND FOR IMPROVED WATER QUALITY.
Water pollution control research series.

Aug 71, 154p W72-08981, EPA-13020-DPB-08/71
Paper copy available from GPO $1.25 as EP2.10:13020 DPB 08/71.

Descriptors: (*Nutrients, Water pollution), (*Surface water runoff, Nutrients), (*Fertilizing, Surface water runoff), Surface water, Phosphorus, Nitrogen, Farm crops, Simulation, Water erosion, Computer programs, Hydrology.
Identifiers: Manure, Water pollution control, Crop rotation.

A rainfall simulator was utilized to determine the effects of 2-, 10-, and 20-year storm frequencies on losses of water, soil and nutrients from plots subjected to different crop rotations, fertilizer schemes and manure applications. Crop rotations, rates of fertilizer and manure were compared. Simulations were made on freshly tilled soil. Comparative erosion losses were as follows: continuous sod - corn - alfalfa rotations continuous corn. Fertilizer alone tended to increase runoff, but this effect was overcome when fertilizer was used with manure. Continuous recording of surface and subsurface flow and subsequent losses of nutrients to the environment was conducted on larger plots. Rate and time of fertilization determined the plant nutrients lost. Returning crop residues to the soil improved water infiltration, increasing deep seepage losses. Phosphorous inputs into cultural media as it related to algal growth was studied. Sustained concentration determined the biomass of phosphorous. (Author)

STUDY OF REUTILIZATION OF WASTEWATER RECYCLED THROUGH GROUND WATER. VOLUME I.
Water pollution control research series,
Doyle F. Boen, James H. Bunts, Jr., and Robert J. Currie. Jul 71, 190p W72-08982, EPA-16060-DDZ-07/71
Paper copy available from GPO $1.50 as EP2.10:16060-DDZ-07/71.

Descriptors: (*Sewage treatment, *Water reclamation), (*Ground water rechange, *Irrigation), Hydrogeology, California, Percolation, Geology, Hydrography, Water quality, Water analysis, Water pollution.
Identifiers: Sewage treatment effluent, *Sewage irrigation, Waste water reuse, San Jacinto River Basin.

A project to demonstrate the feasibility and safety of recycling water under operating conditions was performed in the Hemet-San Jacinto Valley of the State of California. It was felt that recycling of the water would ultimately lead to a reduction in the salt input and resultant degradation of the existing underground reservoir. Extensive geological investigations indicated that the basin was not homogeneous in nature but had clay lenses and faulting which interfered with the creation of a classic mound. Partially as a consequence, the recharge of 5,380 acre feet of wastewater during this six and one-half year period had no effect on surrounding water wells. The project added considerable knowledge and experience to the technology of intermittent wastewater percolation and associated monitoring techniques. A novel feature of the project was the employment of highly sensitive temperature probes to trace the lateral migration of the recharged water. (Author)

Paper copy available from GPO $1.50 as EP2.10:12120 EUR 11/71.

Descriptors: (*Water treatment, *Waste disposal), (*Information retrieval, Water treatment), (*Water services, Waste disposal), Sludge disposal, Public utilities, Regulations, Coagulants, Coagulation, Sludge drying, Reviews, Aluminum sulfates, Materials recovery, Polymers, Centrifuging, Freezing, Lagoons (Ponds), Settling, Vacuum filtration, Project planning, Research, Government policies, Surveys.
Identifiers: Solid waste disposal, Liquid waste disposal, Technology transfer, Water pollution control.

The accomplishments are described of a program conducted to organize, coordinate, and disseminate information on new or modified sludge treatment technology for water treatment plant wastes. The reliable control of these potential pollutants is of increasing importance with the enactment and enforcement of more stringent pollution control legislation. The report contains information on research, engineering, plant operation, and regulatory aspects of the problem. A Project Advisory Committee provided recommendations for development of information resources, and assisted the Research Foundation in structuring an information clearinghouse. The report describes current research activities and new approaches for characterizing and reducing water treatment plant waste volumes. A program was initiated to evaluate the applicability of polymers as primary coagulants, coagulant aids, and sludge conditioning agents. (Author)

MAXIMIZING STORAGE IN COMBINED SEWER SYSTEMS.

Dec 71, 227p W72-08984, EPA-WQO-11022-ELK-12/71
Contract EPA-13-WASH-1
Paper copy available from GPO $1.75 as EP2.10:11022-ELK-12/71.

Descriptors: (*Combined sewers, *Urban planning), (*Storage, Combined sewers), Management, Waste disposal, Flow control, Computer programming, Feasibility, Electronic control, Washington (State), Water pollution.
Identifiers: Seattle (Washington).

A major portion of the Seattle metro area comprehensive sewage collection and treatment plan launched in 1958, included improvements to an existing combined sewer system within Seattle's city limits. Initial plans included interception and treatment of raw sewage flowing to saltwater points, regulation of combined flows to utilize all available trunk storage, and construction of temporary storage tanks at freshwater overflow points. Construction has been completed to demonstrate the feasibility of applying computer-control concepts to make maximum use of all available storage within a collection system.

Identifiers: *Mine acid drainage, Solid waste disposal.

Coal mining produces a variety of environmental problems – acid drainage, sedimentation, surface subsidence and surface scars. The study reviews the response of legal institutions to those problems in Maryland, Ohio, Pennsylvania and West Virginia. Technological and economic concerns are also taken into account. The study discusses the antecedents of today's Appalachian coal industry and the environmental problems it has created. It examines the way in which the property system allocates rights in coal and coal lands, the efficacy of litigation and present laws and regulations for preventing environmental damage, and constitutional limitations on the ability of states to effectively respond to the problems. A case study of the economics of the Maryland coal industry is also presented. Model legislation giving the states the necessary powers to respond to environmental problems, is proposed. (Author)

EUTROPHICATION FACTORS IN NORTH CENTRAL FLORIDA LAKES.
Water pollution control research series,
H. D. Putnam, P. L. Brezonik, and E. E. Shannon. Feb 72, 148p W72-08986, EPA-16010-DON-02/72
Paper copy available from GPO $1.25 as EP2.10:16010-DON-02/72.

Descriptors: (*Limnology, *Nutrients), (*Florida, Limnology), (*Lakes, Limnology), Ecology, Primary biological productivity, Fishes, Plankton, Land use, Demography, Phosphorus, Nitrogen, Phosphates, Nitrates, Ammonia, Fresh water biology.
Identifiers: *Eutrophication.

A small Florida lake has been receiving a regimen of nutrient addition equivalent to 500 mg/cu m-yr N and 43 mg/cu m-yr P since 1967. Data has been accumulated through 1969. The effect on the lacustrine ecosystem of various biogenes includes production by primary producers, species diversity of plankton and certain production estimates at the secondary trophic level using natural populations of planktivorous fish. Related studies on 53 other regional lakes have been done using a multidimensional hybrid concept as defined by several trophic state indicators. This trophic state index has provided a means for ranking the lakes on an arbitrary scale. Land use patterns and population characteristics were determined photographically and N and P budgets estimated. Several significant relationships were found between lake trophic state, lake basin, land use, and population characteristics. (Author)

PROBLEM LAKES IN THE UNITED STATES.
Water pollution control research series,
Martha J. Ketelle, and Paul D. Uttormark. Dec 71, 285p* W72-08987, EPA-16010-EHR-12/71
Paper copy available from GPO $2.00 as EP2.10:16010-EHR-12/71.

Descriptors: (*Lakes, *Limnology), (*United States, Lakes), Surveys, Inventories, Water pollution.
Identifiers: *Eutrophication.

A survey of 452 eutrophic lakes was compiled based on responses from 40 states requesting information as to (a) Name, location, size, depth; (b) Description of the problem, including accounts of previous corrective treatments, if any; (c) Remedial action that might be appropriate; (d) A description of available background data, indicating whether sufficient data exists to document a change if rehabilitation were undertaken. Categories of the problems in the survey were: nuisance algal growth, nuisance aquatic vegetation, fish-kills, bacterial contamination, toxic contamination, oil brines, unstable water levels, siltation, excessive dissolved solids, and unspecified eutrophic conditions. Sources contributing to

these problems were classified in two general categories-rconcentrated sources and diffused sources. Indication is given, where available, whether progress has been made to eliminate the pollution source. (Author)

Descriptors: (*Holography, *Aerosols), (*Particles, *Light scattering), (*Limestone, Steam boilers), (*Air pollution, Holography), Backscattering, Fly ash, Calcium carbonates, Concentration (Composition), Ruby lasers, Mathematical models, Computer programs, Photomicrography.
Identifiers: *Limestone injection, Air pollution control.

Investigation was initiated to increase the utility of the holographic technique in its application to limestone plume distribution studies. The following results were achieved with respect to the program objectives: The feasibility of holographically recording ruby laser backscatter from aerosols of flyash, chalk dust and incense; A mathematical model was derived which yields particle number density estimates from forward low angle scattered light intensity measurements of reconstructed holographic images recorded under specified conditions; Pulsed ruby laser holograms of a dioctyl phthalate aerosol of known characteristics were recorded and used to verify the derived mathematical model; A method of real image hologram reconstruction was demonstrated to facilitate direct measurement of scattered light intensities and corresponding spatial locations; A computer program of the derived mathematical model was written and utilized for particle number data reduction. The smoke particles corresponding in size to the wavelength of ruby light were recorded. The report describes the apparatus and methods used in each of these major tasks. (Author)

CHLORINATED MUNICIPAL WASTE TOXICITIES TO RAINBOW TROUT AND FATHEAD MINNOWS.

Oct 71, 53p W72-09154, EPA-18050-GZZ-10/71
Paper copy available from GPO $0.60 as I67.13/4: 18050-GZZ-10/71.

Descriptors: (*Toxicity, *Fishes), (*Chlorination, *Industrial wastes), Aquatic biology, Urban areas, Water pollution, Sewage treatment, Water quality, Toxic tolerances, Trout, Minnows.
Identifiers: *Rainbow trout, *Fathead minnows.

Effect of chlorinated municipal wastes on fish life and laboratory findings of earlier researchers were assessed in separate studies at four Michigan municipal wastewater treatment plants. Tolerance levels and river length below each plant outfall rendered unavailable to resident fish populations were determined. Ten rainbow trout (Salmo gairdneri) and ten fathead minnows (Pimephales promelas), previously acclimated, were held 96 hours in live boxes in the stream above and below these outfalls. Fish held below these outfalls were subjected to both chlorinated and non-chlorinated exposures during effluent discharge. Test waters were monitored chemically and bacteriologically during fish exposure. Total residual chlorine concentrations below three plants were toxic to rainbow trout at distances up to 0.8 mile. Fathead minnows appeared adversely affected up to 0.6 mile downstream in two of the four plants. Total residual chlorine concentrations less than 0.1 mg/l were toxic to fathead minnows. Rainbow trout 96-hour total residual chlorine TL-50 concentration below two plants was 0.023 mg/l.

USE OF GENERAL EQUILIBRIUM IN REGIONAL WATER RESOURCE PLANNING.
Water pollution control research series.

Jan 72, 165p W72-09228, EPA-16110-FIO-01/72
Paper copy available from GPO $1.50 as I67.13/4: 16110 FIO 01/72.

Descriptors: (*Regional planning, *Economic models), (*Water resources, Regional planning), Optimization, Prices, Supply (Economics), Control, Computer programs, Allocations, Equilibrium, Water pollution.

General equilibrium analysis is shown to be a feasible tool for estimating the optimal level of public goods in a regional economy and the optimal allocation of public funds to obtain the desired level. This analysis provides a methodology for investigating the externalities associated with various forms of production. An interaction or trade mechanism is presented which will force a regional economy into equilibrium with the economy in which it is embedded: Relative prices will be identical in these economies for their common commodities. A technique is presented by which all public goods can be treated in a general equilibrium framework. (Author)

DISTRIBUTIONAL ECOLOGY AND BEHAVIORAL THERMOREGULATION OF FISHES IN RELATION TO HEATED EFFLUENT FROM A STEAM-ELECTRIC POWER PLANT (LAKE MONONA, WISCONSIN).
Technical rept.,
Willima H. Neill, and John J. Magnuson. Mar 72, 110p W72-09236, OWRR-B-028-WIS (3)
Contract DI-14-01-001-3142

Descriptors: (*Water pollution, *Electric power plants), (*Fishes, *Ecology), Cooling water, Temperature, Zooplankton, Temperature gradients, Feeding habits, Seasonal variations, Fresh water biology.
Identifiers: *Thermal pollution, *Water pollution effects (Plants).

Lake Monona (Dane County, Wisconsin) provides water for cooling the condensers of a coal and gas fired power plant (220 Mw). After a 10C, water is returned to the lake. To assess the distributional responses of fish to the operation of the power plant, the outfall area and two reference areas were electro-fished thirty times over a one-year period. Some fishes found in the reference areas avoided the outfall area, whereas other fishes were at higher concentration in the outfall area relative to the reference sites. Integrated laboratory studies on six species and field results suggest that fishes were distributed within the outfall area according to their different temperature preferenda. (Author)

BASIN MANAGEMENT FOR WATER REUSE.

Feb 72, 291p* W72-09381, EPA-16110-EAX-02/72
Paper copy available from GPO $2.25 as EP2.10: 16110-EAX-02/72.

Descriptors: (*Water supply, Water reclamation), (*Sewage treatment, *Water reclamation), Water treatment, Regional planning, Cost estimates, Computer programs, Seasonal variations, Texas, Activated carbon treatment, Calcium oxide, Clarification, Ion exchanging, Activated sludge process, Water pipelines.
Identifiers: Waste water reuse, Tertiary sewage treatment, San Antonio (Texas).

The project explored what is required and what happens if some or all of the sewage collected from a municipality is treated by advanced waste treatment (AWT) and put back in the water distribution system. Quality requirements and results of water reuse were examined by using computer programs for the preliminary design and costing of wastewater renovation by the lime-clinoptilolite-carbon processes of advanced waste treatment; for activated sludge treatment; and for pipeline conveyance of water. San Antonio, Texas was used as a specific case, at the two extremes of discharge all and reuse none and discharge none and reuse all. Costs for the conventional system and that reusing wastewater are discussed. (Author)

Descriptors: (*Sewage treatment, Clarification), (*Clarification, Mathematical models), Clarifiers, Settling, Concentration (Composition), Solids, Activated sludge process, Hydraulics, Design criteria.

The final clarifier in the activated sludge process performs a vital role in secondary waste treatment systems. The purpose of the project was to develop a mathematical model to predict the solids concentration of both the underflow and overflow of a final clarifier as a function of the mixed liquor characteristics. It was concluded that neither the effluent suspended solids nor the return sludge concentration can be estimated with good accuracy from those parameters which are normally available to the design engineer. Recommendations for future work which would enable a more realistic approach to the preliminary design of final clarifiers are made. (Author)

WASTEWATER AMMONIA REMOVAL BY ION EXCHANGE.
Feb 71, 110p W72-09383, EPA-17010-ECZ-02/71
Contract FWQA-14-12-561
Prepared in cooperation with South Tahoe Public Utility District, South Lake Tahoe, Calif.
Paper copy available from GPO $1.25 as EP2.10: 17010-ECZ-02/71.

Descriptors: (*Ammonia, *Ion exchanging), (*Chemical removal (Sewage treatment), Ammonia), (*Sewage treatment, Ammonia), Design criteria, Ion exchange resins, Ammonium compounds, Columns (Process engineering), Pilot plants, Regeneration (Engineering), Reclamation, Strippers, Electrolysis, Cost estimates, Capital costs, Operating costs, Engineering design, California.
Identifiers: Clinoptilolite, Zeolites, Tertiary sewage treatment, Lake Tahoe.

Pilot plant investigations of a nitrogen removal system employing a natural zeolite, clinoptilolite, which is selective for ammonium ions in the presence of sodium, magnesium, and calcium ions, were conducted. The system was operated on both clarified and carbon treated secondary effluent and clarified raw sewage. Regeneration was accomplished by reacting the exhausted zeolite with hydroxyl ions to form an alkaline aqueous ammonia solution suitable for air stripping and discharge to the atmosphere. The regenerant solu-

tion is not discarded and no liquid wastes are generated. A 7 1/2 mgd plant was designed based on the pilot plant data. Estimates for operational costs and construction costs, based on current costs are given. (Author)

WASTEWATER DEMINERALIZATION BY ION EXCHANGE.
Water pollution control research series.

Dec 71, 134p W72-09384, EPA-17040-EEE-12/71
Contract FWQA-14-12-599
Paper copy available from GPO $1.25 as EP2.10: 17040-EEE-12/71.

Descriptors: (*Sewage treatment, *Ion exchanging), (*Demineralizing, Sewage treatment), (*Water reclamation, Sewage treatment), Activated sludge process, Chemical removal (Sewage treatment), Phosphates, Design criteria, Cation exchanging, Sewage filtration, Cost estimates, Waste disposal, Performance evaluation.
Identifiers: Waste water reuse, Liquid waste disposal, Tertiary sewage treatment.

The feasibility of wastewater demineralization by ion exchange procedures was successfully demonstrated by pilot plant studies conducted on sewage effluent from an activated sludge treatment plant. A pretreatment unit consisting of lime clarification, dual media filtration, and granular activated carbon filtration was operated in series with the ion exchange system. Phosphate reductions were achieved by lime clarification at pH 10.0, but identical reductions were achieved by ion exchange alone. In addition ion exchange treatment without lime was cheaper. Ion exchange processes using strong acid cation exchange resin and weak base anion exchange resin can be readily applied to wastewater demineralization. Design of treatment plants for such a process applied to wastewater containing as much as 500 mg/l of ionizable solids can use established design parameters. Disposal of sludges and saline liquids must be considered.

Identifiers: *Whey, *Reverse osmosis, *Water pollution control, Cottage cheese whey, Food supplements, *Ultrafiltration.

An ultrafiltration reverse osmosis system for the treatment of cottage cheese whey has been successfully demonstrated on both the laboratory and pilot plant scale. A protein concentrate is recovered in the ultrafiltration step and the remaining deproteinized whey is concentrated by reverse osmosis to provide a lactose concentrate. Both concentrates can either be processed further or used directly as liquids. Membrane life was excellent and membrane fluxes were economically high. Costs are given which include the income from the sale of protein and lactose substitutes.

WASTE TREATMENT LAGOONS - STATE OF THE ART.
Water pollution control research series.

Jul 71, 156p W72-09386, EPA-17090-EHX-07/71
Paper copy available from GPO $1.25 as EP2.10: 17090-EHX-07/71.

Descriptors: (*Sewage treatment, *Lagoons (Ponds)), (*Reviews, Lagoons (Ponds)), Oxidation, Aeration, Anaerobic processes, Aerobic processes, Microbiology, Design criteria.
Identifiers: Aeration ponds, *Sewage lagoons, Anaerobic lagoons.

A review of published literature and field evaluations revealed the presence of over 3500 waste treatment lagoons currently in operation in the United States. The three types of lagoons in use include: Oxidation lagoons; Aerated lagoons; and Anaerobic lagoons. Oxidation lagoons depend upon algae to supply oxygen by photosynthesis and degrade the waste products. Effluent quality is determined by the quantity of algae in the effluent and several methods of algae removal are currently under investigation. Aerated lagoons may be merely oxidation ponds with supplemental aeration, partially mixed activated sludge (facultative aerated) or complete mix activated sludge (CMAS) systems. Anaerobic lagoons can provide up to 80% BOD removals, but must be followed by some type of aerobic treatment to produce a high quality effluent. The review has demonstrated that lagoons do have applicability to the total waste treatment problem.

MAGNESIUM CARBONATE, A RECYCLED COAGULANT FOR WATER TREATMENT.
Water pollution control research series.

Jun 71, 116p W72-09387, EPA-12120-FSW-06/71
Paper copy available from GPO $1.00 as EP2.10: 12120-ESW-06/71.

Descriptors: (*Water treatment, *Clarification), (*Coagulants, *Magnesium carbonates), (*Coagulation, Water treatment), Precipitation (Chemistry), Magnesium hydroxides, Calcium oxides, Performance evaluation, Sludge disposal, Reclamation, Regeneration (Engineering), Cost estimates, Operating costs, Chemical reactions, Decoloring.

Laboratory investigations into the use of magnesium carbonate instead of alum for coagulation have demonstrated that the magnesium carbonate system produces a treated water with superior characteristics compared to water treated with alum. Both turbidity and organic color removals were comparable for both processes, and the flocs formed by the magnesium carbonate process were larger and heavier than alum flocs with better settling characteristics. The process involves the use of the magnesium carbonate as a coagulant and lime is added to precipitate gelatinous Mg (OH)2. The sludge, composed of a slurry of Mg (OH)2, CaCO3, and clay is carbonated and the Mg (OH)2 selectively and completely dissolved. Recycle after filtering allows re-use of both the magnesium carbonate and the sludge water. CaCO3 can also be recovered easily in large plants or landfilled at small ones. Chemical treatment costs for most waters can be substantially reduced using this system, while the quality of treated water will be superior to the quality of alum-treated water. (Author)

Identifiers: Waste water reuse, Precipitants, Liquid waste disposal.

Of a number of methods available for phosphate removal from waste water, chemical precipitation (often called coagulation) using aluminum, ferric iron, ferrous iron and lime is considered to be the most economical. The objective of the present study has been two-fold: To evaluate the effects of pH and reactant concentration on the rate and efficiency of phosphate removal from synthetic and secondary effluent wastewaters and on the nature of the precipitates formed; and to compare the data on the Fe (II)-phosphate precipitation system with the available data for Fe (III)- and Al (III)-phosphate systems. Most of the experiments in the study were conducted on pure orthophosphate solutions and in the absence of dissolved oxygen. Only a limited number of tests were made of the use of ferrous iron for orthophosphate removal from wastewaters containing dissolved oxygen. (Author)

A process (called UNOX) for treating municipal wastewater using high-purity oxygen in the activated sludge process was further evaluated at Batavia, New York in a full scale wastewater treatment plant. The present evaluation places emphasis on the production rate, filtration, and digestion characteristics of oxygenated waste activated sludge. Operation was conducted at two different system loadings over a period of three months. The filtering characteristics of waste activated sludge from an oxygenation system were investigated. Waste activated sludge was aerobically digested in 800-gallon batches using high-purity oxygen. The economics of oxygenation systems as compared with conventional diffused air aeration systems were revised from the cost estimates presented in initial work. (Author)

Identifiers: Biological industrial waste treatment, Solid waste disposal, *Liquid waste disposal, Aeration ponds, *Water pollution control.

It has been estimated that the approximately 1800 plants in the canned and frozen fruits and vegetables industry in the U.S. annually utilize 26 million tons of raw product, discharge 83 billion gallons of wastewater, generate 800 million pounds of BOD and 392 million pounds of suspended solids, and produce 8 million tons of solid residuals. Flow diagrams are presented for peaches, peas, corn, beets, and tomato products, and proportions of the total liquid waste flow, BOD, and SS from each of 5 or 6 processing steps for 15 commodities are estimated. Several conventional waste treatment methods are presented, along with their potential application to the food processing industry. Liquid waste treatment and/or discharge costs for a synthetic average plant in the industry are estimated including annual capital and operation and maintenance costs. Seven hundred references are listed.

Identifiers: *Motor vehicle inspection, *Automobile exhaust, Air pollution abatement.

The report summarizes the results of research on the effects of mandatory vehicle inspection and maintenance which were investigated to assess the most cost-effective procedures for periodically diagnosing and restoring to specification those engine components having significant effects on vehicle exhaust emissions. Typical average emission reductions over a four year period are given. It was found that the most cost effective inspection frequency is once yearly using state inspection lanes and nondispersive, infrared emission measurement instruments.

Identifiers: *Motor vehicle inspection, *Automobile exhaust, Air pollution abatement.

The effects of mandatory vehicle inspection and maintenance for maintaining air pollution emission standards were investigated. The development of the inspection/maintenance (I/M) economic effectiveness model and the study results are described. A literature survey was made and direct discussions were held with automobile manufacturers and automobile associations to acquire applicable cost and operational data and to identify candidate inspection/maintenance procedures. Statistical evaluations of acquired data were performed to develop models of inspection procedures, maintenance effectiveness and deterioration and capital costs. An internally consistent system model was constructed using both contract developed and acquired data to evaluate the economic effectiveness of four candidate inspection/maintenance strategies.

THE ECONOMIC EFFECTIVENESS OF MANDATORY ENGINE MAINTENANCE FOR REDUCING VEHICLE EXHAUST EMISSIONS. VOLUME III. INSPECTION/MAINTENANCE PROCEDURES DEVELOPMENT.

20 Aug 71, 194p APTD-1075
Contract CPA-22-69-087
See also Volume 2, PB-209 952.

Descriptors: (*Automobiles, Inspection), (*Air pollution, Exhaust gases), (*Automobile engines, *Exhaust gases), Experimentation, Maintenance, Feasibility studies, Economic models, Carbon monoxide, Hydrocarbons, Nitrogen oxides, Tests, Carburetors, Air cleaners.
Identifiers: *Motor vehicle inspection, *Automobile exhaust, Air pollution abatement.

The experiments performed to develop, characterize, and rank motor vehicle inspection and maintenance procedures to maintain air pollution emission standards are described. The experimental data were developed from the following sequence of investigations: An engine parameter field survey to characterize the general maintenance state of vehicle emission control systems; A screening experiment to select the most frequent and extensive malfunctioned engine parameters; and a definitive experiment to select and evaluate the most effective parameters to maintain in an inspection as determined by combining the data from the previous two experiments. These experiments were designed to yield a consistent set of data to support the emissions models. Inspection procedures using both direct engine parameter and emission diagnosis were developed with these data.

Identifiers: *Air pollution detection, Automobile exhaust.

A project was conducted to design, fabricate, and test a particulate emission monitor utilizing a beta radiation attenuation and filter sampler technique. The instrument was to have a minimum sensitivity of 125 plus or minus 25 micrograms per cubic meter and be capable of operation in either a manual or automatic mode of operation. Carbon-14 was selected as the optimum isotope and a filter 'cassette' was used to collect the particles. The effect of moisture absorption by various types of filter media were investigated and reported. A series of tests were performed on automobiles using leaded, low-leaded and non-leaded fuels. The results of these tests are reported as well as recommendations for future effort. (Author)

May 71, 31p APTD-1014

Descriptors: (*Real property, *National government), (*Air pollution, *Illinois), Inventories, Distribution (Property), Regions, Urban areas, Buildings.

The series of reports is a summary compilation of the major facilities of real property owned by the Federal Government in the various states. The installations are listed alphabetically by the city in which they are located and the listing includes a brief description of the installation, the agency which operates the facility, the GSA inventory number, the GSA location code, the total floor area of all the buildings and a size classification code. The operating agency and installation descriptions are those reported to the General Services Administration as of June 30, 1970. Installations with a total floor area less than 1,500 sq. ft. have been omitted since experience indicates that they do not present any air pollution potential. For prices of individual reports, see below:

The series of reports is a summary compilation of the major facilities of real property owned by the Federal Government in the various states. The installations are listed alphabetically by the city in which they are located and the listing includes a brief description of the installation, the agency which operates the facility, the GSA inventory number, the GSA location code, the total floor area of all the buildings and a size classification code. The operating agency and installation descriptions are those reported to the General Services Administration as of June 30, 1970. Installations with a total floor area less than 1,500 sq. ft. have been omitted since experience indicates that they do not present any air pollution potential. For prices of individual reports, see below:

REGIONAL AIR POLLUTION STUDY: A PROSPECTUS. PART I. SUMMARY.
Final rept.
Jan 72, 102p* APTD-1122
Contract EPA-68-02-0207
See also Part 2, PB-210 018.

Descriptors: (*Air pollution, Research management), (*Regional planning, Air pollution), Mathematical models, Site surveys, Laboratories, Objectives, Abatement, Atmospheric physics, Public health, Economic analysis, Meteorological data, Sources, Inventories, Data processing, Cost estimates, Research projects.
Identifiers: Regional air pollution study.

The problem of effectively managing air quality within the framework of current legislation on a regional basis is extensive and complex. The need to evaluate and improve control strategies already adopted or to identify new approaches must be considered on this basis. By effectively coordinating efforts on a number of interrelated problems, a combination of resources can be brought to bear on the problems of air quality management. It is the purpose of the Prospectus to identify the separate elements constituting such an undertaking and to describe how it can be carried out. In the report the major concept of RAPS (Regional air pollution study) is presented, with an outline description of the Research Plan, the Facility, and the Management Plan (which includes budgetary information).

Identifiers: Regional air pollution study, Technology transfer.

The report describes the research plan to be used in the Regional Air Pollution Study (RAPS) which is being developed to aid in improving and controlling regional air quality. A comprehensive overview is provided of the three principal components contained in the process of air pollution: Meteorological processes; Atmospheric chemistry and transformation processes; and The emissions sources The specific research tasks to be carried out are defined. The contents include: Overview of air pollution modeling; Meteorological processes; Atmospheric chemistry and transformation processes; Emission estimates; Economic and social impact studies; and [illegible]logy transfer.

Identifiers: Regional air pollution study, Air pollution sampling, Saint Louis (Missouri).

The conceptual definition and detailed discussion of the permanent instrument, data-handling, and processing facility planned for the Regional Air Pollution Study (RAPS) are presented. The facility, by its design and mode of operation, is intended to provide the basic support to the research efforts. The St. Louis, Missouri facility is conceived as consisting of a system of air quality and meteorological instrument stations established within an area roughly enclosed by a circle of 100-km radium with the St. Louis arch as its center. A central support facility is also planned, which includes data-handling and processing equipment, office and laboratory space, and repair and maintenance shops. (Author)

HYBRID PROPULSION SYSTEM TRANSMISSION EVALUATION. PHASE I.
Final rept.,
M. A. Cordner, and D. H. Grimm. 25 Feb 72, 388p*
SA/AER-640 APTD-1121
Contract EPA-68-04-0034

Descriptors: (*Motor vehicles, *Air pollution), (*Automotive transmissions, Performance evaluation), Motor vehicle drive systems, Flywheels, Feasibility, Cost estimates, Design, Automobiles, FORTRAN, Computer programs, Analog simulation, Digital simulation.
Identifiers: *Hybrid vehicular propulsion, Air pollution abatement, *Hydromechanical transmissions.

The purpose was to assess the practicality of a transmission for use in a heat engine/flywheel propulsion system to reduce emissions. The system was to be suitable for incorporation into a full size 'family car' automobile. The different possible link types (mechanical, hydrostatic, and hydromechanical) between the engine, flywheel, and vehicle wheels were analyzed. Many transmission schematics were investigated, and several combinations were selected for further evaluation resulting in the final recommended configuration. Controls were selected and analyzed using a digital dynamic simulation computer program and an analog computer simulation. System performance, stability and driveability were deterined. Cost estimates were made for the selected configuration using comparative data, vendor quotations and in-house estimates. Comparisons with a conventional three speed automatic transmission were made. A hydromechanical transmission configuration with interdependent links between the flywheel, engine, and wheels was the resultant selection. The flywheel/transmission was configured for a tranaxle installation, which was considered optimum. (Author)

DESIGN AND CONSTRUCTION OF A SALT-WATER ENVIRONMENT SIMULATOR,
Waldemar A. DeBen. Apr 70, 36p Working Paper-71 W72-09553, EPA-16070-04/70

Descriptors: (*Environment simulators, *Estuaries), Design, Performance evaluation, Dissolved gases, Salinity, Ecology, Aquatic biology, Automatic control, Temperature control, Water pollution.

An experimental, continuous-flow bioassay apparatus was designed to utilize and stabilize salt water derived from an estuarine source. The prototype was constructed to provide a single-test supply of up to 8 liters of water per minute at 4 levels of selected temperature and a near-constant concentration of any selected salinity or dissolved oxygen. Called the 'Saltwater Environment Simulator', this apparatus is intended for use in evaluating pollution effects and natural environmental changes on marine and estuarine animals. The experimental procedure is described and illustrated with drawings of the simulator. Tests indicate that controlled environmental conditions can be provided to define some of the physiological requirements of test animals living under estuarine conditions that can be related to ecological field studies.

RESEARCH ON THE PHYSICAL ASPECTS OF THERMAL POLLUTION.

Feb 71, 205p W72-09728, EPA-WQO-16130-DPU-02/71
Contract FWQA-14-12-526
Paper copy available from GPO $1.75 as stock no. 5501-0143, EP 2.10:16130-DPU-02/71.

Descriptors: (*Water pollution, Heat), (*Lakes, Temperature distribution), Thermoclines, Mixing, Turbulent diffusion, Seasonal variations, Plumes, Mathematical models, Interfaces, Electric power plants, Stratification.
Identifiers: *Thermal pollution.

The mechanisms of formation and maintenance of the characteristic thermal structure of deep, temperate lakes were investigated along with the effects on that thermal structure of heat discharges from electric generating plants. Thermoclines develop because of nonlinear interaction between surface turbulence and buoyancy gradients from surface heating. A theoretical model including the interaction of those factors predicts the observed features of stratification accurately. Thermal discharges increase the temperature to a different degree at different levels of the entire lake. Discharges also increase the depth of the thermocline and lengthen the stratification period. An exploratory experimental study is described on the nature of the interfacial mixing between a flowing layer of warm water and an underlying cooler pool of water. (Author)

Paper copy available from GPO $0.75 as stock no. 5501-0122, EP2.10:16130GKF12/70.

Descriptors: (*Cooling towers, Mathematical models), Design criteria, Air flow, Heat transfer coefficient, Mass transfer, Pressure drag, Performance evaluation, Computer programs, Water pollution, Heat.
Identifiers: Natural draft cooling towers, Water pollution control.

A method that does not assume saturated air at the top of the packing is developed for analyzing the performance of counterflow and crossflow natural draft cooling towers. Types of cooling towers and the principles of operation are considered. Simplified differential equations for the heat and mass transfer relations and the methods of integrating them for both counterflow and crossflow towers are given. A large number of integration steps is unnecessary. Equations for estimating the pressure losses in the tower are also given. Simplified flow charts using these integration schemes show how the computer program is used to evaluate tower performance. The computed performance of towers of various heights operating in moist and in dry conditions is shown. The effect of inlet water temperature is significant. The computed performance of a given tower with fixed inlet water temperature is shown as a function of relative humidity and dry bulb air temperature. The computer program and instructions for its use are included. (Author)

K. D. Stolzenbach, and D. R. F. Harleman. Feb 71, 216p W72-09729, EPA-WQO-16130-DJU-02/71
Paper copy availaale from GPO $1.75/copy as EP2.10:16130-DJU-02/71.

Descriptors: (*Water pollution, Heat), (*Stream pollution, Heat), (*Hydraulic models, Temperature distribution), Turbulent flow, Mixing, Plumes, Mathematical models, Theories, Electric power plants, Computer programs.
Identifiers: Thermal pollution.

The prediction of temperature within the region dominated by turbulence from a heated discharge was investigated. A three-dimensional theory is developed, based on a turbulent jet model and including density gradients and surface heat loss. Of interest in formulating the theory is the dependence of the temperature distribution in the receiving water on the temperature difference between discharge and ambient water, the initial discharge velocity, the channel geometry, the bottom slope, the ambient cross flow, and surface heat transfer. Experiments were performed in a laboratory basin in which all of the relevant parameters, including cross flow and bottom slope, are varied and temperatures are measured in the heated discharge. The experiments verify the theoretical predictions.

EXPERIMENTAL EVALUATION OF FIBROUS BED COALESCERS FOR SEPARATING OIL-WATER EMULSIONS.
Water pollution control research series.

Nov 71, 99p W72-09580, EPA-12050-DRC-11/71
Paper copy available from GPO $1.75 as EP2.10:12050 DRC 11/71.

Descriptors: (*Oils, *Coalescing), (*Coalescers, Fabrication), Glass fibers, Tests, Performance evaluation, Regeneration (Engineering), Water pollution, Plastic coatings, Design, Operating costs, Cost estimates.
Identifiers: *Oil water separators, *Oil pollution removal.

A laboratory scale oil-water coalescer bed was formed from standard, phenol formaldehyde coated fiber glass, consisting of 3 layers. The bed was then compressed between screens to an overall thickness of 1/4 inch, giving an apparent overall density to the working membrane of 10.8 lb/cu ft. By testing the cell on a synthetic oil dispersion and an actual pollutant stream, a 100% coalescence efficiency at a 7.5 gpm flow rate over the entire run time was established. Stabilization of fibers to mechanical degradation was accomplished by coating the compressed fibers with isobutyl methacrylate resin. This medium, showing the same coalescence efficiency and pressure drop characteristics for the original medium, was regenerable by solvent treatment. Operating costs based on single use of fibers were estimated.

Paper copy available from GPO $1.00 as EP2.10:17020-DDC-06/71.

Descriptors: (*Waste treatment, Adsorbents), (*Activated carbon, *Porosity), (*Coal, Activated carbon), (*Graphite, Activated carbon), Industrial water, Activation, Heat treatment, Air, Carbon dioxide, Area, Microporosity.
Identifiers: Surface area.

Recognizing the potential value of activated carbons for removal of water pollutants, the present study was initiated for the general purpose of obtaining information on the effect of the porous structure of carbon on carbon activation. Reaction rates and porous structures of a calcined Wyoming coal activated by air and by carbon dioxide and a graphite activated by carbon dioxide were measured. Total, macropore and micropore volumes, surface area and pore-size distributions were determined as functions of burnoff. Although pore growth can be described, it cannot yet be predicted.

Identifiers: Biological industrial waste treatment, *Water pollution control.

A systems evaluation was made to determine the feasibility and economics of treating selected steel mill and sanitary wastewaters in a municipal sewage treatment plant. The project was Phase I of a three phase program to demonstrate that industries and municipalities through cooperative action can combine their wastewaters and attain their individual treatment goals in an efficient and economical manner. Detailed field work was carried out at the steel plant and the total sewage plant treatment system. Selected steel plant wastes were combined with municipal wastes and evaluated in both batch and continuous treatability bench scale studies. The investigation revealed that that it is technically and economically feasible to co-treat selected steel plant wastes with municipal wastewaters. (Author)

Paper copy available from GPO $1.00 as EP2.10:17090-07/70.

Descriptors: (*Sewage treatment, Cost estimates), (*United States, Sewage treatment), Sewers, Sanitary engineering, Capital costs, Operating costs, Economic analysis, Collection.
Identifiers: Per capita costing, Water costs.

The national average per capita cost for collection and treatment of municipal wastewater was computed based on the 1968 Inventory of Municipal Waste Treatment Facilities in the United States and per capita cost relationships for building and operating collection and treatment facilities. All costs are given per capita served with treatment facilities using the level of treatment existing in 1968. The cost of collection is about three times as expensive as treatment. The current status of collection and treatment in the United States is discussed and estimates are made of needed additional expenditure.

Identifiers: *Air pollution control, Limestone injection, Waste gas recovery.

The preliminary design of 650 KW pressurized (10 atmosphere) fluid bed coal combustor is described. The system will consist of a 12-inch ID combustor and a 5-inch ID regenerator, with provisions for continuous solids circulation between the two reactors. The results of an experimental study conducted with the objective of determining methods of simultaneously obtaining low SO (x) and NO (x) emissions from a fluidized bed coal combustor are reported. In fixed bed reactor studies, a reaction system involving NO, SO2, and CaO was identified. The apparent order of this reaction was about 0.5 and it had a negative temperature dependence. The reduction of NO by CO over CaSO4 was also studied in fixed bed experiments and found to proceed at appreciable rates in the 1300 F to 1700 F.

Identifiers: *Limestone injection, *Air pollution control.

The research was to model the geometry and flow conditions of the Shawnee Unit 10 Boiler during the dry limestone injection process. The basic goal was to determine the penetration and dispersion characteristics of the limestone injection. A cold-gas model was selected with a geometric scale factor of 12.5 to 1. The combustion gases and the solid-gas injection flow conditions in the boiler were simulated by keeping the values of the relevant dimensionless parameters for the model as close as possible to those of the full scale Shawnee unit. The degree of dispersion of the limestone was characterized by a percent coverage value which in effect is the fraction of complete mixing of the limestone and SO2. Percent coverage values were calculated for the Shawnee boiler for each of the three injection levels. The same was done for the model at one turbulence level and then additional tests were conducted at a fixed injection level under various turbulence conditions.

Identifiers: *Air pollution detection, *Automobile exhaust, Polymer gas permeability.

The purpose was to develop an electrochemical transducer which would selectively oxidize formaldehyde in the midst of all of the other gas species present in the exhaust stream of internal combustion engines. The current generated by this device would be amplified and displayed in a manner which would permit quantitative analysis of the formaldehyde concentration. The sensor which was developed was not as selective as proposed. However, its lack of selectivity applies only to members of the aldehyde family. It is equally sensitive to all aldehydes. The problem of evaluating the sensor's performance necessitated the completion of two other significant achievements: production of a reliable formaldehyde standard in the 1ppm concentration range; and development of a wet method of analysis which would give accurate yet fairly rapid measurements at this low level of pollutant.

Water pollution control research series,
Ralph P. Collins. Oct 71, 30p W72-10076, EPA-16020-GDQ-10/71
Paper copy available from GPO $0.50 as EP2.10:16020 GDQ 10/71.

Descriptors: (*Water supply, *Odors), (*Microorganisms, Odors), (*Taste, Water supply), Fungi, Bacteria, Algae, Ohio, Great Lakes, Phytoplankton, Sampling.
Identifiers: *Lake Erie, Cleveland (Ohio).

Periodic taste and odor at the Cleveland, Ohio Crown Water Treatment Plant prompted investigation of the role microorganisms play in the problem. Fungi, bacteria, and algae collected near the plant intake were studied during June through August 1971. During the three months of sampling, no vertical distribution pattern was noted in quantitative analysis of the phytoplankton. A number of algae, reported to induce taste and odor in water, were identified. Whatever the source of these odors, they were not due to benthic or periphyton algae, but could have been associated with the phytoplankton community as the reported 'Lake Erie odor' coincided with phytoplankton increase.

THE PHYSICAL DESULFURIZATION OF COAL-MAJOR CONSIDERATIONS OF SO2 EMISSION CONTROL,
L. Hoffman, and K. E. Yeager. Nov 70, 322p MTR-4151 APTD-0844
Contract F19628-68-C-0365

Descriptors: (*Desulfurization, Coal preparation), (*Economic factors, *Coal preparation), (*Air pollution, *Sulfur dioxide), Cost estimates, Benefit cost analysis, Abatement, Coal deposits, Capital costs, Operating costs, Taxes, Sources, Sulfur, Concentration (Composition).
Identifiers: *Air pollution economics, *Air pollution abatement, Low sulfur fuels.

The major economic factors which will affect the application of coal physically cleaned to 1% total sulfur content as an SO2 emission control method for stationary power sources were examined. The individual cost factors associated with producing physically desulfurized coal and the economic benefit factors associated with the use of this coal were defined and quantified. Thirty potential physically desulfurized coal source/user combinations were analyzed to indicate the range of economic system variability to be expected. (Author)

AICE SURVEY OF USSR AIR POLLUTION LITERATURE. VOLUME XII. TECHNICAL PAPERS FROM THE LENINGRAD INTERNATIONAL SYMPOSIUM ON THE METEOROLOGICAL ASPECTS OF ATMOSPHERIC POLLUTION. PART 1,
M. Y. Nuttonson. Jan 72, 139p AICE-AIR-72-12 APTD-1117
See also Volume 11, PB-209 478.

Descriptors: (*Air pollution, *Atmospheric diffusion), (*USSR, Air pollution), Meetings, Electric power plants, Plumes, Concentration (Composition), Atmospheric composition, Smoke, Turbulent diffusion.
Identifiers: Air pollution forecasts.

Twelve papers dealing with the meteorological aspects of air pollution were translated. These papers were initially presented at an international symposium held in Leningrad during July 1968. The papers are: Status and prospective development of meteorological studies of atmospheric pollution; Effect of the stability of the atmosphere on the dissemination of gaseous pollutants; Method of determination of average impurity concentration near an electric power plant by means of an electronic computer; Methods of calculation of the surface concentration of a gaseous impurity discharged from an elevated source; Results of experimental study of smoke plumes from thermal power plants; Atmospheric diffusion and structure of the air flow above a nonuniform underlying surface; Procedure for calculating the pollution of the atmosphere with discharges of industrial plants and thermal power plants; Statistical forecasting average atmospheric pollution; Method of calculating the degree of atmospheric pollution; On the determination of diffusion parameters for actual locations; Turbulence in the lower 500 M layer and diffusion of impurities; and, Atmospheric turbulence at small heights.

INCINERATOR OVERFIRE MIXING STUDY,
C. Michael Mohr, and Adel F. Sarofim. Feb 72, 242p* ADL-72940 APTD-1133
Contract EPA-EHSD-71-6

Descriptors: (*Combustion, Incinerators), (*Incinerators, Air pollution), (*Air pollution, Combustion products), (*Refuse disposal, Air pollution), Carbon monoxide, Oxidation, Design criteria, Mixing, Baffles, Mathematical models, Gas flow, Jet mixing flow, Bibliographies.
Identifiers: *Air pollution control, *Solid waste disposal, Overfire mixing.

The processes occurring in a burning refuse bed are analyzed to yield estimates for the rate and quantity of combustibles emitted from the bed. Gases of over 14% carbon monoxide content can be released. Methods are then developed to analyze the flow through the furnace. The analysis shows that stratification of the flow and incomplete mixing of fuel and sufficient oxygen-containing gases can occur. Design equations are presented describing the behavior of overfire air or steam jets for mixing, tempering and/or bringing oxygen to the combustible gases. Refuse incinerator overfire air system design methods developed from the above analyses are presented and contrasted with similar design methods for solid fuel bed coal-firing furnaces. (Author)

AIRPHOTO ANALYSIS OF OCEAN OUTFALL DISPERSION.
Water pollution control research series,
Fred J. Burgess, and Wesley P. James. Jun 71, 292p W72-10146, EPA-16070-ENS-06/71
Paper copy available from GPO $2.25 as EP2.10:16060 ENS 06/71.

Descriptors: (*Outfall sewers, *Plumes), (*Oceans, Outfall sewers), (*Remote sensing, *Water pollution), Aerial photography, Dyes, Dispersing, Ocean currents, Wind velocity, Photogrammetry, Computer programs, Waste disposal.
Identifiers: *Water pollution detection, Liquid waste disposal, *Ocean waste disposal.

The objective of the research was to develop a remote sensing tool for the evaluation of dispersion of wastes from existing or proposed ocean outfalls. Photogrammetric and photo interpreta-

tion methods were used to determine dispersion patterns, diffusion coefficients, waste concentrations and nearshore currents. The study is unique in that the aerial photography is not only used to determine the position of points and the size of objects as in normal photogrammetry, but the photograph is also used as an energy sensor. Procedures were developed using dye drops from an airplane. The water current velocity was found to be the dominant factor in the resulting plume pattern. Characteristic airphoto pattern elements are given for visual interpretation of the photography.

COMPLETE MIX ACTIVATED SLUDGE TREATMENT OF CITRUS PROCESS WASTES.
Water pollution control research series.

Aug 71, 123p W72-10223, EPA-12060-EZY-08/71
Paper copy available from GPO $1.25 as EP2.10: 12060 EZY 08/71.

Descriptors: (*Food processing, *Industrial waste treatment), (*Citrus fruits, Food processing), Activated sludge process, Aeration, Calcium oxides, Nutrients, Nitrogen, Phosphorus, Cost estimates, Capital costs, Operating costs, Sludge digestion.
Identifiers: *Citrus fruit processing, *Water pollution control, Biological industrial waste treatment.

A full-scale, complete mixed activated sludge treatment system effectively treats concentrated citrus process wastes. This process has a BOD reduction capability of 99 percent; but it produces 0.5 to 0.6 pounds of waste sludge per pound of influent BOD. The efficiency was reduced by periodic foaming and solids carryover in the effluent caused by the unscheduled discharge of orange oil and peel press liquor to the treatment plant. Controlling the addition of nitrogen and phosphorus to the influent of the nutrient deficient wastewater effectively controlled effluent nitrogen and phosphorus concentrations. Waste sludge was mixed with citrus peel and processed as a cattle feed additive in the existing facilities. The waste activated sludge represented approximately 1.5 percent of the total cattle feed production on a dry weight basis. Treatment plant effluent was reused for barometric leg and cooling water and was then discharged. (Author) Costs are presented.

WHEY EFFLUENT PACKED TOWER TRICKLING FILTRATION.
Water pollution control research series.

Sep 71, 186p W72-10226, EPA-12130-DUJ-09/71
Paper copy available from GPO $1.50 as EP2.10: 12130 DUJ 09/71.

Descriptors: (*Food processing, *Industrial waste treatment), (*Dairy products, Food processing), Sewage treatment, Trickling filtration Activated sludge process, Mathematical models, Computer programming, Process variables, Cost estimates, Operating costs, Capital costs.
Identifiers: *Whey, *Water pollution control, Biological industrial waste treatment.

Waste waters containing whey from the manufacture of cheese are notorious for causing waste treatment problems, whether treated alone or in conjunction with other wastes including domestic sewage. The purpose of the project was the development of activated sludge and biological filtration processes applicable to the treatment of whey-bearing wastes. The scope included the determination of mathematical models of process performance, the preparation of computer programs for process design, and the evaluation of methods for dewatering secondary sludges.

Paper copy available from GPO $1.00 as EP2.10: 16110 FRU 12/71-10.

Descriptors: (*River basin development, *Decision making), (*Regional planning, River basin development), (*Highway planning, River basin development), Water resources, Local government, Mathematical models, Computer programming, Gaming models, Government policies, Management planning.
Identifiers: Water pollution abatement.

The River Basin Model is not primarily a water management model. Through human interaction and computer simulation, it and its users represent the major economic, social, and governmental decision-making which causes a regional system to function and change on a year-to-year basis. As part of the functioning of this system, water is demanded by industries and municipal water suppliers and pollution is generated by manufacturing and commercial activities, by people, and by farm activities. A gaming format is employed; model users provide inputs to the computer programs on behalf of business activities in the Economic Sector, groups of people or population units in the Social Sector, and government departments in the Governmental Sector. The Governmental Sector and the model required by its Highway Department are described.

STATE OF HAWAII AIR POLLUTANT EMISSION INVENTORY,
Clyde B. Morita. Jan 70, 71p APTD-0817

Descriptors: (*Air pollution, *Hawaii), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Seasonal variations, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Evaporation, Waste disposal, Demography.
Identifiers: *Air quality data, *Implementation Air Pollution Planning Program.

The sources and emissions of air pollutants for Hawaii are outlined. Estimates are provided of total emissions of oxides of sulfur, oxides of nitrogen, hydrocarbons, carbon monoxide and particulate matter. The emissions of these pollutants are delineated with respect to source type, season of the year, and by their geographical distribution within the area. The current level of emissions and status of their control was also determined. The general procedure for these surveys is based on the rapid survey technique. Emissions for the most part are estimated using various indicators of pollutant emissions and average emission factors that are related to these. (Author)

INVESTIGATION OF EMISSIONS FROM PLYWOOD VENEER DRYERS.
Revised final rept.

Feb 72, 141p APTD-1144
Contract CPA-70-138

Descriptors: (*Air pollution, *Hydrocarbons), (*Wood products, Air pollution), (*Plywood, *Drying), Veneers, Industrial wastes, Concentration (Composition), Quantitative analysis, Gas chromatography, Gas analysis, Thin layer chromatography, Particles, Terpene hydrocarbons.

The emissions from thirteen plywood dryers drying ten different specie types were studied. The objectives of the study included the determination of the physical and chemical nature of the emissions from these dryers during the drying of various veneer species under normal conditions of operation and the evaluation of process differences which might account for the observed differences in visual emissions. Determinations were made of the volatile and condensable hydrocarbon emissions. Visual observations of the equivalent opacity of the stack emissions were also made. Process and materials variables were documented to attempt to determine causes for the variations in hydrocarbon emissions.

Descriptors: (*Air pollution control equipment, *Combustion products), (*Air pollution, Combustion products), (*Sulfur dioxide, Air pollution control equipment), (*Nitrogen oxides, Air pollution control equipment), Activated carbon, Oxidation reduction reactions, Catalysis, Electric power plants, Sulfur trioxide, Nitrogen dioxide, Feasibility, Design criteria, Sulfuric acid, Nitric acid, Scrubbers, Strippers, Catalysts.
Identifiers: *Air pollution control, *Waste gas recovery, *Catalytic chamber process, *TYCO process.

The Catalytic Chamber Process is aimed at solving one of our most pressing air pollution problems: the emission of enormous quantities of sulfur dioxide and nitrogen oxides into the atmosphere from the stacks of power plants burning fossil fuels. The process features the oxidation of SO2 to SO3 through the use of nitrogen dioxide as a homogenous, gas-phase, reactive catalyst in a manner similar to the old Lead Chamber Process. The objective was to: Confirm the technical feasibility of the Catalytic Chamber Process, and Obtain preliminary engineering design data necessary for process scale-up. A laboratory-scale investigation was made of the separate process stages and of an integrated 10 SCFM unit. Three major modifications were investigated. The sulfur dioxide oxidation and the nitric oxide oxidation were performed in separate stages; A high temperature scrubber was used; and A catalytic stripper was used to simultaneously remove the oxides of nitrogen from the scrubbing acid and oxidize them to nitrogen dioxide.

Descriptors: (*Air pollution, *Infrared detection), (*Gas detectors, Infrared detection), (*Ethylene, Gas detectors), (*Ammonia, Gas detectors), Field tests, Performance evaluation, Carbon dioxide lasers, Infrared lasers, Absorption spectra, Errors, Electromagnetic interference, Design, Transmittance, Remote sensing.
Identifiers: *Air pollution detection, Laser spectroscopy.

The purpose of the research was to conduct a field study on the merits and limitations of laser coincidence absorption measurement technique applied to long-path monitoring of a gaseous pollutant in an urban atmosphere. Two gaseous pollutants, ethylene and ammonia, were selected and spectral interferences identified. Using a spectrally tunable CO2 laser, measurements and system evaluation were conducted. Selected pollutant concentrations and spectral interference effects were recorded. Concurrent point measurements were made by gas chromatograph for ethylene concentrations. Overall system effectiveness and test results were analyzed and performance evaluated.

DESIGN CONSTRUCTION AND EVALUATION OF A MOBILE LIDAR SYSTEM FOR THE REMOTE MEASUREMENT OF SMOKE PLUME OPACITY.
Final rept. 24 Dec 69-21 Dec 71,
C. S. Cook, and G. W. Bethke. Dec 71, 100p* APTD-0968
Contract EPA-68-02-0093

Descriptors: (*Air pollution, *Optical radar), (*Detectors, Optical radar), (*Particles, Detectors), (*Smoke, Detectors), Design, Mobile equipment, Transmittance, Light scattering, Back scattering, Monitors, Optics, Reflectance, Field tests, Plume detection, Visibility, Ruby lasers, Performance evaluation, Errors, Remote sensing.
Identifiers: *Air pollution detection.

A mobile (truck mounted) ruby laser lidar system has been designed, constructed and evaluated for the remote measurement of smoke plume opacity (or transmittance). The system has been tested at ranges of 211 and 319 meters using synthetic targets of known laboratory measured transmittance. The targets used were made of bright and black anodized aluminum screen, glass, plexiglass, white painted plywood and black felt. These tests indicated an error which increased as target reflectance increased. In general, the lidar and telephotometer determined transmittance values agreed within the accuracy expected for a given plume transmittance as indicated by the synthetic target test results. Plume-to-sky contrast (plume visibility) was found to have no correlation with plume transmittance because of the variability of ambient illumination of the plume.

Identifiers: Thermal stratification, *Fontana Reservoir.

Predictions of the complex annual cycle of temperature changes in a lake or reservoir are necessary if proper water quality control is to be achieved. Many lakes and reservoirs exhibit horizontal homogeneity and thus a time-dependent, one-dimensional model describing the temperature variation in the vertical direction is adequate. A discretized mathematical model was developed based on the absorption and transmission of solar radiation, convection due to surface cooling and advection due to inflows and outflows. The model contains provision for simultaneous or intermittent withdrawal from multi-level outlets and time of travel for inflows within the reservoir. (Author)

Identifiers: *Thermal pollution.

A readily usable model was developed for evaluating the extent of plumes from large evaporative cooling towers. Mathematical models were used to describe the dynamics of the wet cooling tower plume and its interaction with the environment. Primary emphasis was placed on predicting the height of the plume. Classical atmosphere diffusion theory was used to determine the downwind spread. The saturation deficit of the atmosphere controls the downwind spread of and fogging used by the plume. A map of the U.S. indicating locations of potential adverse atmospheric effects due to cooling towers can be used in conjunction with local data. Appendix contains a description of the computer program, including input specifications.

The River Basin Model is a man-machine simulation model used to delineate the interactions taking place, within a real or hypothetical area, between the local water system and the economic, social, and governmental activities of that area; it is a model of an entire regional system, with water a subsystem realistically interacting with all the other major subsystems, such as transportation and housing. A gaming format is employed, and Model users provide inputs to the computer programs which simulate the major processes. The functions of the computer are presented, and the computer printed output is described in detail. The computer stores and updates all relevant statistics for the area, simulates the actions of the outside systems (such as a national business cycle), and performs certain routine, otherwise time-consuming processes (such as calculating a comprehensive water quality index). THE EFFECTS OF ARTIFICIAL AERATION ON LAKE ECOLOGY.
Water pollution control research series,
Arlo Wade Fast. Dec 71, 494p W72-10605, EPA-16010-EXE-12/71
Paper copy available from GPO $4.25 as EP2.10:16010EXE12/71.

Descriptors: (*Aeration, Water pollution), (*Lakes, Ecology), Limnology, Benthos, Zooplankton, Fishes, Dipthers, Stratification, Dissolved gases, Oxygen, Primary biological production, Aquatic animals, Mixing, Water chemistry, Michigan.
Identifiers: *Eutrophication, *Water pollution control, Midges, Winterkilling.

Two Michigan lakes, eutrophic Lake Hemlock and oligotrophic Section Four Lake, were artificially aerated by compressed air from mid-June to September. Only the hypolimnion of the eutrophic

lake was aerated which resulted in increased oxygen concentration from 0.1 mg/l to over 10.0 mg/l while thermal stratification was maintained. Zooplankton, zoobenthos, and fish distributed throughout the lake after aeration. Midges emerged from the deepest point. Aeration apparently reduced nutrient anaerobic regeneration but increased nutrient regeneration through aerobic decomposition of profundal sediments. Artificial destratification of the oligotrophic lake greatly increased the minimum temperature budget. No appreciable winterkill occurred and many trout overwintered without any known ill effects.

DISSOLVED AND PARTICULATE ORGANIC CARBON IN SOME COLORADO WATERS.
Water pollution control research series,
Edward B. Reed. Oct 71, 84p W72-10606, EPA-16010-EQA-10/71
Paper copy available from GPO $1.00 as EP2.10:16010EQA10/71.

Descriptors: (*Water analysis, *Carbon), (*Water supply, Carbon), (*Colorado, Water supply), Particles, Organic compounds, Sampling, Limnology, Rivers, Lakes, Water pollution, Bacteria.
Identifiers: *Organic carbon.

Instantaneous amounts of organic carbon, both particulate and dissolved, in a number of freshwaters ranging from unproductive tarns to moderately productive reservoirs were measured by acid-persulfate digestion and infrared absorption. Organic carbon was designated as net seston carbon, filter seston carbon, or dissolved carbon based on filtering techniques. Repeated sampling showed amounts of organic carbon, either dissolved or particulate, fluctuated considerably over short periods of time; the dissolved fraction probably varying less than particulate forms. Almost daily measurements in samples incubated over three week periods also revealed erratic changes, with no clear reduction in total organic carbon. The data have descriptive value, although they cannot, at this time, be related satisfactorily to the general limnological knowledge.

NUTRIENT SOURCES FOR ALGAE AND THEIR CONTROL.
Water pollution control research series,
George P. Fitzgerald. Aug 71, 85p W72-10608, EPA-16010-ENR-08/71
Paper copy available from GPO $1.00 as EP2.10:16010EHR08/71.

Descriptors: (*Indicator species, *Nutrients), (*Water pollution, Nutrients), (*Algae, *Limnology), Phosphorus, Sources, Bioassay, Nitrogen, Mud, Adsorption, Acetylene, Rainfall, Surface water runoff, Ecology.
Identifiers: *Water pollution effects (Plants).

Bioassays for nutrient availability were evaluated to define conditions and limits under which each method can give meaningful results. The biological availability of algal nutrients in a water sample and the algal response to changes in the growth-limiting nutrient were measured. Factors other than insolubility prevent the nitrogen or phosphorus of certain samples of aerobic lake muds from being readily available for algal growth. The facts, that live algae and aquatic weeds do not share their adequate or surplus nutrients with nutrient-limited algae and that lake muds do not provide readily available nitrogen or phosphorus, indicate that once lake waters are stripped of available nutrients by plant production, further plant production will depend upon nutrients from continuous sources, such as wastewater effluents. Phosphorus-starved cells of Anabaena rapidly increase their capacity to reduce acetylene to ethylene when they receive phosphorus. This response may be used as a bioassay for detecting available phosphorus in aquatic ecosystems. (Author)

EUTROPHICATION IN COASTAL WATERS: NITROGEN AS A CONTROLLING FACTOR.
Water pollution control research series.

Dec 71, 68p W72-10611, EPA-16010-EHC-12/71
Paper copy available from GPO $0.70 as EP2.10:16010EHC12/71.

Descriptors: (*Oceans, *Outfall sewers), (*Outfall sewers, *Water pollution), Marine biology, Phytoplankton, Primary biological productivity, Nitrogen, Ammonia, Ammonium compounds, Nitrates, Metabolism, Nutrients, Coasts.
Identifiers: *Ocean waste disposal, Liquid waste disposal, *Water pollution effects (Plants), *Eutrification, *Environmental biology.

The Southern California coastal sewage outfalls were investigated in relation to their effect upon standing stocks of phytoplankton, and on primary production. Kinetic parameters for the assimilation of ammonium, nitrate, and urea were determined at the outfall sites using N-15 labeled substrates. Laboratory studies investigated the utilization of various forms of nitrogen by phytoplankton, mechanisms and rates of nitrogen assimilation, and enzymes of nitrogen assimilation. It was found that the maximum growth rate was a variable, while the saturation constant was uniform over a range of dilution rates of N-limited chemostat cultures. The chemical composition of phytoplankton varied with dilution rate in reproducible ways. By varying the dilution rate of such cultures one seems to regulate the degree of nitrogen-deficiency of the phytoplankton.

ENFORCEMENT MANAGEMENT SYSTEM. USERS GUIDE.

Mar 72, 218p* TRC-42-088-00 APTD-1120
Contract EPA-68-02-0079

Descriptors: (*Air pollution, *Law enforcement), (*Management systems, Air pollution), Abatement, Data processing, Monitors, Sources, Scheduling, Management engineering, Data acquisition, Information systems.

A system was developed for use by air pollution agencies at the state and local levels. The system records, monitors, summarizes agency actions in the enforcement and surveillance area. It provides staff members with schedules of planned future actions and summaries of emission source oriented data. The system is available in three versions, tailored to agencies of different resource levels. Two of the levels are computerized and provide automatic monitoring of operational activities.

Descriptors: (*Air pollution, *Infrared detection), (*Nitrogen dioxide, Gas detectors), (*Sulfur dioxide, Gas detectors), Monitors, Performance evaluation, Calibration, Wind (Meteorology), Industrial wastes, Plumes.
Identifiers: *Air pollution detection.

Independent remote-sensing data were desired for comparisons to final acceptance tests of infrared remote sensors. A dual-gas correlation spectrometer was used to measure sulfur dioxide (SO2) and nitrogen dioxide (NO2) simultaneously. Perimeter measurements were made in the general vicinity of an industrial area in Southern California. Next a comparison was made between the COSPEC II Correlation Spectrometer and the COSPEC III version.

PAINT TECHNOLOGY AND AIR POLLUTION: A SURVEY AND ECONOMIC ASSESSMENT,
J. W. Spence, and F. H. Haynie. Feb 72, 49p* AP-103
Paper copy also available from SOD: as EP 4.0:103 PC$0.35.

Descriptors: (*Paints, *Atmospheric corrosion), (*Air pollution, Atmospheric corrosion), Deterioration, Reviews, Economic analysis, Hydrogen sulfide, Sulfur dioxide, Particles, Latex, Enamel paints, Painting.
Identifiers: *Air pollution effects (Materials), *Air pollution economics, *Paint industry.

The objectives were to survey the technical developments occurring within the paint industry, to identify the characteristics of pollutant attacks on exterior paints, and to estimate the annual cost of air pollutant damage to such paints. New paint formulations and new application techniques are emerging within the paint industry. The chemical attack of certain air pollutants on exterior finishes is reviewed. An economic assessment was made of the chemical damage of air pollutants on four classes of exterior paints: Household, Automotive refinishing, Coil coating, and Maintenance. The total estimated cost at the consumer level is given.

SYSTEMATIC FIELD STUDY OF NO (X) EMISSION CONTROL METHODS FOR UTILITY BOILERS,
William Bartok, Allen R. Crawford, and Gregory J. Piegari. 31 Dec 71, 229p* GRU4GNOS71 APTD-1163
Contract CPA-70-90

Descriptors: (*Boilers, *Combustion products), (*Air pollution, *Nitrogen oxides), (*Combustion, Boilers), Furnaces, Field tests, Natural gas, Coal, Fuel oil, Design criteria, Gas sampling, Statistical analysis, Process variables, Carbon monoxide, Electric power plants, Gas burners, Oil burners.
Identifiers: *Air pollution control.

A utility boiler field test program was conducted. The objectives were to determine new or improved NO (x) emission factors by fossil fuel type and boiler design, and to assess the scope of applicability of combustion modification techniques for controlling NO (x) emissions from such installations. A statistically designed test program was conducted with the cooperation of utility owner-operators. The objective was to make the boilers selected a reasonable 'micro-sample' of the U.S. boiler population. The NO2 portion of the total NO (x) content in the flue gas was found to average five percent or less. Major combustion operating parameters investigated included the variation of boiler load, level of excess air, firing pattern (staged, 'off-stoichiometric', or 'biased firing'), flue gas recirculation, burner tilt, and air preheat temperature. Modification of combustion operating conditions offers good promise for the reduction of NO (x) emissions from utility boilers.

A QUICK BIOCHEMICAL OXYGEN DEMAND TEST.

Jun 71, 48p W72-10871, EPA-16050-EMF-06/71

Paper copy available from GPO $0.60 as EP2.10: 16050 EMF 06/71.

Descriptors: (*Biochemical oxygen demand, Tests), Sewage treatment, Industrial waste treatment, Quantitative analysis, Biochemistry, Errors.
Identifiers: *Chemical oxygen demand, Biological industrial waste treatment, Water pollution detection.

A satisfactory, short term biological oxygen demand test suitable for operational control of waste treatment processes was developed. The Total Biological Oxygen Demand T (BOD) test, a mass culture technique which utilizes the change in chemical oxygen demand as resulting from bacterial action, was chosen as the basic system. Because the T (BOD) test was developed for and is conceptually limited to soluble wastewaters, considerable modification of the basic test was necessary. Results show that the modified T (BOD) test can be utilized for the determination of the oxygen demand of nonsoluble wastewaters. Values were not affected by dilution as long as the initial (time equals O) wastewater COD value was greater than 100 mg/l. Of greater utility is the development of COD vs T (BOD) correlations for a specific wastewater, however.

Identifiers: PILLS detection, *Air pollution detection.

Instrumentation for measurement of low level drift from cooling towers was developed. Emphasis was placed on the Particulate Instrumentation by Laser Light Scattering (PILLS) System which is capable of on-line measurement and, with incorporation of existing pulse height analyzer and mini-computer equipment, complete on-line data production. Complementary techniques of isokinetic sampling (IK) and sensitive paper sampling were developed and field proven. Feasibility was demonstrated for an infrared in-line holocamera system. The design principles and engineering trade-offs for the PILLS, IK, and sensitive paper techniques are described. Drift performance data are given for a small air conditioning cooling tower unit, two large mechanical draft cooling towers, and a natural draft tower. (Author)

Descriptors: (*Bubbling, Equipment), (*Flotation, Bubbling), (*Suspended sediments, Flotation), Vortices, Design, Nozzles, Dissolved gases, Entrainment, Sewage treatment, Industrial waste treatment.

An engineering investigation and evaluation of vortex devices as bubble makers for use in the removal of suspended solids from wastewaters was conducted. Specific objectives included the development and test of bubble makers capable of generating bubbles having mean diameters of about 100 microns with vortex devices having minimum liquid passageways of 1/4 inch or greater. Bubbles having a mean diameter of 80 to 85 microns, with virtually no bubbles greater than 130 microns, were successfully produced. This mean size and size range are substantially the same as bubbles produced by pressurized water processes at similar operating pressures. Bubbles were produced both by aspirating atmospheric air directly into the vortex unit, and by aspirating atmospheric air at the suction side of the pump, dissolving it, and precipitating it or effervescing it at the vortex unit. Sufficient data now exist, however, to design vortex systems for direct functional tests in conventional air flotation systems.

Paper copy available from GPO $1.75 as EP2.10: 11020 DNO 03/72.

Descriptors: (*Combined sewers, *Flushing), Mathematical models, Efficiency, Deposits, Sediments, Hydraulic equipment.
Identifiers: Storm sewers.

Full-scale tests were conducted on two variable-slope test sewers (12- and 18- inch diameters), during which solids were first allowed to build up by passing domestic sewage through the sewers for durations of 12 to 40 hours and then were removed by hydraulic flushing. Formulas were developed which gave satisfactory predictions of several cleansing efficiencies and wave depths for the flush waves and sewer sizes studied. A prototype flush station developed can be inserted in a manhole to provide the functions necessary to pick up sewage from the sewer, store it in a coated fabric tank, and release the stored sewage as a flush wave upon receipt of an external signal. An estimate of costs of periodically flushing combined sewer laterals are given.

Identifiers: *Precipitation washout.

Recent results are presented in the continuing investigation of SO2 washout by precipitation from plumes of large, coal-fired power plants. The research consisted of three phases: a washout modeling effort, a laboratory investigation of solubility and mass-transfer behavior in the SO2/water system, and an experimental field program. The modeling effort resulted in the creation of two washout models. The first of these is based on linear theory and provides a relationship that can be used for hand-calculated estimates of washout provided that the implicit assumption of vertical rainfall is not violated significantly. The second model can account for nonlinear behavior and is not restricted to vertical rainfall, but necessitates computer calculation to predict washout values. Solubility experiments were conducted. The field-study program was conducted on the Olympic Peninsula of Washington state to examine the washout of SO2 in an unpolluted atmosphere. Irreversible washout was shown to be untenable. Predictions from the nonlimiting washout models were found to agree well with experiments.

REVERSE OSMOSIS DEMINERALIZATION OF ACID MINE DRAINAGE.
Water pollution control research series.

Mar 72, 113p W72-11598, EPA-14010-FQR-03/72
Paper copy available from GPO $1.00 as EP2.10:14010 FQR 03/72.

Descriptors: (*Mine waters, *Osmosis), (*Demineralizing, Mine waters), (*Water pollution, Mine waters), Field tests, Filtration, Disinfection, Ultraviolet radiation, Fouling, Corrosion prevention, Water treatment, Potable water, Chemical removal (Water treatment), Iron, Manganese, pH.
Identifiers: *Mine acid drainage, *Reverse osmosis, *Water pollution control, Tubular membranes, Hollow fiber membranes.

A two-phase study, involving both laboratory and field investigations, has demonstrated the feasibility of using reverse osmosis to provide potable water from acid mine drainage. The laboratory investigations involved the determination of methods for controlling iron fouling and the selection of a process flow sheet. During the field test, the process developed in Phase I was used to treat acid mine drainage from an underground abandoned anthracite coal mine. Treatment prior to reverse osmosis consisted of filtration (10 microns) followed by ultraviolet light disinfection. Brine from the RO unit was treated by neutralization, oxidation, and settling. Results obtained indicated that membrane fouling due to iron was satisfactorily controlled, but calcium sulfate fouling limited the recovery of product water to about 75%. Product water was of potable quality in all respects except for iron, manganese, and pH. Calcium sulfate precipitate on the RO membrane was successfully removed using a solution of ammoniated citric acid at pH 8. (Author)

Identifiers: *Reverse osmosis, *Water pollution control, *Waste water reuse, Dissolved solids, Tubular membranes.

Pilot plant reverse osmosis (R.O.) units were operated on weak waste waters from a pulp and paperboard mill to obtain further data on R.O. as an integral part of a closed water system within the mill. Of the many equipment types tested, the one selected was capable of concentrating a stream containing 1% dissolved solids to 99% less volume containing 10% dissolved solids. Product water thus separated was of high quality, suitable for use for stock dilution, pump shaft seal lubrication, etc. Overall flux rate for the operating portion of a plant performing to these standards was about 7 gallons/sq ft/day. The cellulose acetate membranes exhibited no significant deterioration, and a conclusion that the membranes are capable of providing a minimum of one year of continuous service is encouraged. Limited testing at higher temperatures indicated that the membranes do not deteriorate as rapidly as predicted.

CLOSED SYSTEM WASTE MANAGEMENT FOR LIVESTOCK.
Water pollution control research series,
Patrick O. Ng, Jr., Jerome P. Harper, Robert K. Collins, Grant D. Wells, and Farouk A. Heidar.
Jun 71, 113p W72-11600, EPA-13040-DKP06/71
Paper copy available from GPO $1.25 as EP2.10:13040DKP06/71.

Descriptors: (*Agricultural wastes, *Industrial waste treatment), (*Livestock, Agricultural wastes), (*Filtration, Agricultural wastes), Separators, Sizing screens, Separation, Swine, Beef cattle, Centrifugal filtration, Feeding stuffs, Biochemical oxygen demand, Nitrogen, Phosphorus, Chemical analysis, Performance evaluation, Sand filtration, Composts, Anaerobic processes, Aerobic processes, Odor control, Dissolved organic matter.
Identifiers: Manure, *Water pollution control, *Feedlot wastes, *Hog houses, Chemical oxygen demand, Biological industrial waste treatment.

A vibrating screen separator has been developed for liquid-solid separation of livestock wastewater. Pilot tests on swine and beef cattle wastewater have shown that the resistant or slowly biodegradable solids are effectively removed on vibrating screens ranging in mesh size from No. 60 to No. 120. Although measurably less efficient than conventional dewatering devices such as centrifuges and vacuum filters, the gravity dewatering vibrating screen separation is better suited to the economic scale of the average livestock operation. The removal of resistant solids from wastewater prior to stabilization substantially improves the performance of biological treatment systems by enhancing the controlling transport and kinetic mechanisms in such processes. The liquid fraction can be partially reclaimed by biodegradation and recycled as transport water. A number of candidate livestock waste management designs integrating the salient features of the study have been proposed.

ELIMINATION OF WATER POLLUTION BY PACKINGHOUSE ANIMAL PAUNCH AND BLOOD.
Water pollution control research series.

Nov 71, 47p W72-11601, EPA-12060-FDS-11/71
Paper copy available from GPO $0.50 as EP 2.10: 12060 FDS 11/71.

Descriptors: (*Food processing, *Industrial waste treatment), (*Beef cattle, Food processing), Livestock, Blood, Dewatering, Cost estimates, Feasibility, Separation, Waste disposal, Dehydrators, Capital costs, Operating costs, Clarification, Lagoons (Ponds), Aeration, Biochemical oxygen demand.
Identifiers: *Slaughtering house wastes, *Water pollution control, Paunch, Chemical oxygen demand, Food supplements, *Blood dehydration.

At a beef slaughtering plant, the kill capacity can be 250 animals per hour. In a ten-hour day this represents a tremendous quantity of blood, paunch, and manure, which must be disposed of in such a way so as not to further tax the waste-carrying capacity of the nearby rivers or to increase the ever growing problem of pollution of air, land, and water. Thus it was decided to test facilities for the drying of the whole blood and the paunch contents of rumen generated in the slaughtering operation. The manure would be disposed of directly for agricultural fertilizer. The project demonstrates the economic and technical feasibility of completely separating the blood and rumen generated in the slaughter operation, and drying of these materials with a view toward the sale of the dehydrated products as animal feeds or for feed additives.

AEROBIC DIGESTION OF ORGANIC WASTE SLUDGE.
Water pollution control research series.

Dec 71, 184p W72-11603, EPA-17070-DAU-12/71
Paper copy available from GPO $1.50 as EP2.10: 17070 Dau 12/71.

Descriptors: (*Sudge digestion, *Aerobic processes), (*Sewage treatment, Sludge digestion), Process variables, Pilot plants, Aeration, Settling, Chemical removal (Sewage treatment), Biochemical oxygen demand, pH, Nitrogen, Phosphorus.
Identifiers: Chemical oxygen demand.

Many new ideas for sludge treatment and disposal have been proposed and put into use in recent years. The method most commonly used is that of anaerobic digestion followed by dewatering of sludge. However, for at least the last 10 or 15 years aerobic sludge digestion has been used or experimented with. Aerobic sludge digestion is a process in which waste sludges are subjected to aeration by various means to reduce the amount of sludge and to make it less objectionable estheticly. Pilot plant aerobic sludge digesters were used to treat sludge from a two stage trickling filter plant. Primary sludge only, mixed primary and secondary sludge, and secondary sludge only, were digested at detention periods. Physical and chemical analyses were made. Data indicated considerable variation in concentration of the various parameters with aeration time and sludge source. Results showed that aerobic digestion was a highly variable process which could produce excellent results in some cases, while yielding highly undesirable results in similar cases.

Ralph P. Collins. Aug 71, 20p W72-11604, EPA-16040-DGH-08/71
Paper copy available from GPO $0.35 as EP2.10:16040DGH08/71.

Descriptors: (*Water supply, *Odors), (*Taste, Water supply), (*Aquatic microbiology, Odors), Algae, Fungi, Actinomycetaceae, Gas chromatography, Infrared spectra, Mass spectra, Nuclear magnetic resonance, Water pollution, Water quality, Streptomyces.
Identifiers: Trichoderma viride, Synura.

An examination of the odorous constituents produced by microorganisms which are involved in taste and odor problems in public water supplies was conducted. The organisms used in the study were the actinomycete Streptomyces odorifer, the alga Synura petersenii, and the fungus Trichoderma viride. The odorous constituents produced by these organisms were obtained by steam distillation of the culture medium containing the cells. Analysis of the extracts was made by gas chromatography, infrared, mass and nuclear magnetic spectroscopy. The major odorous constituents produced by Streptomyces odorifer have been identified. A large number of odorous constituents were also identified from the culture filtrates Synura petersenii. The major odorous compound produced by Trichoderma viride was also determined.

SLUDGE MATERIAL RECOVERY SYSTEM FOR MANUFACTURERS OF PIGMENTED PAPERS.
Water pollution control research series.

Jul 71, 97p W72-11605, EPA-12040-FES-07-71
Paper copy available from GPO$1.00 as EP2.10: 12040 FES 07/71.

Descriptors: (*Paper industry, *Industrial waste treatment), (*Pigments, *Materials recovery), (*Sludge disposal, Paper industry), Incinerators,

Papermaking, Pulp additives, Finishes, Fluidized bed processors, Cost estimates, Dewatering, Waste disposal.
Identifiers: *Water pollution control, Waste recycling, Rotary kilns.

Disposal of the sludge that results from primary treatment of waste waters generated during the manufacture of coated and/or filled papers has caused many problems. A process has been developed and tested in a full scale mill trial wherein the pigment present in the waste sludge was reclaimed through incineration of the volatile components of the sludge. In essence, the process consisted of operations in which the sludge resulting from the primary treatment process was diluted to less than 0.75% solids, centri-cleaned, dewatered to 30% solids, shredded, dried, and burned in a rotary kiln. The ash that resulted - the pigment - was then pulverized and used as filler pigment in the papermaking process. The process was shown to be economically unfeasible at the present time. (Author)

AMENABILITY OF REVERSE OSMOSIS CONCENTRATE TO ACTIVATED SLUDGE TREATMENT.
Water pollution control research series.

Jul 71, 123p W72-11606, EPA-17040-EUE-07/71
Paper copy available from GPO $1.25 as EP2.10:17040 EUE 07/71.

Descriptors: (*Sewage treatment, *Osmosis), Activated sludge process, Water supply, Performance evaluation, Membranes, Feasibility, Dissolved organic matter, Precipitation (Chemistry), Feedwater treatment, Fouling, Cellulose acetate, Suspended sediments, Pilot plants, Clarification, Chemical removal (Water treatment).
Identifiers: Tubular membranes, Spiral wound membranes, *Reverse osmosis.

Pilot scale tubular and spiral wound Reverse Osmosis (RO) units were used to establish the feasibility of renovating municipal sewage. Results indicated that prior treatment with ferric chloride and alum will be necessary even when using the tubular RO system. RO produced an approximate 100 mg/ TDS of inorganic ions in the effluent, but an estimated 40 to 50% of the soluble organic material permeated the membranes at high feed water recoveries. Approximately 70% of the organic material passing the membrane was ethanol, but other organics may pass through the membranes from other sewages. 92% water recovery rates, with no precipitation problems in the RO concentrate, were achieved, but RO product waters would require further treatment for organic removal prior to discharge. The feasibility of biodegrading RO concentrates was also established.

Identifiers: *Alkaline scrubbing, *Air pollution control.

The study was carried out to develop a theoretical description of aqueous scrubbing processes for NOx emission control. The theoretical description is necessary to provide a basis for process development. The important chemical species present and the reactions they undergo in the sorption process were defined. An equilibrium model was developed so that the concentrations of the significant nitrogen-oxygen species present in the gas phase could be calculated under given conditions. A sorption mechanism and rate limiting step were proposed and an experimental program for testing them and providing engineering data was defined. Potential metal oxide sorbents were evaluated for effectiveness and efficiency on the basis of the thermodynamics of the sorption reactions. (Author)

Descriptors: (*Crude oil, Availability), (*Fuel oil, Availability), (*Fuels, *International trade), Residual oils, Surveys, Sulfur, Air pollution, Concentration (Composition).
Identifiers: *Sulfur containing fuels, Imports, Air pollution abatement.

The document, a supplement to an initial report on 'Oil Availability by Sulfur Levels (PB-202 281),' presents data on imports of residual and fuel oils for the period January 1968 through December 1971. Also included are imports of distillate fuel oil for January 1970 through December 1971. Import data on these fuels were considered essential to acquiring an understanding of use distributions in the various areas and states. Presented is the quantity and sulfur content of the fuel oils. Other parameters deemed necessary were country from which the fuel oil came (source), United States port through which it came, and the carrier or company that imported the fuel oil. Analyses of such data in relation to legislature restrictions on sulfur content of fuel oils in the separate states are included.

Identifiers: *Feedlot wastes, *Water pollution control, Water pollution effects (Animals), Fish-kill, Manure.

Effects of rainfall runoff from a beef cattle feedlot on the water quality of a small impoundment were determined. Changes in chemical concentration of

impounded water and changes in the community structure of aquatic organisms were measured and related to the amount and composition of feedlot runoff received. Water quality changes were also monitored in a nearby reservoir which received no feedlot runoff to serve as a control. Changes in chemical concentration or population structure of organisms were not apparent for discharges of about one-part feedlot runoff to 40 parts receiving water. Runoff discharges for two pumping periods with each contributing one-fourth of the volume of the receiving water were shown to degrade water quality in the impoundment. Several significant chemical and biological changes occurred. The most dramatic reduction in the biological community was the suffocation of about 90% of the game fish in the impoundment.

BIOMASS DETERMINATION. A NEW TECHNIQUE FOR ACTIVATED SLUDGE CONTROL.
Water pollution control research series.

Jan 72, 118p W72-12006
Contracts EPA-14-12-419, EPA-14-12-871
Paper copy available from GPO $1.25 as EPA17050EOY01/72.

Descriptors: (*Activated sludge process, *Microorganism control (Sewage)), (*Biomass, Analyzers), (*Adenosine phosphates, *Bioluminescence), (*Sewage treatment, Microorganism control (Sewage)), Metabolism, Monitors, Tests, Process control.

Research was conducted to determine the feasibility of using adenosine triphosphate (ATP) as a measure of viable biomass in activated sludge. Methods were developed for the extraction of ATP from sludge and mixed liquor, and for the determination of ATP using the firefly bioluminescent procedure. Measurements of ATP were conducted on various pure cultures, pilot plant and full-scale activated sludge treatment plants. Additional parameters including BOD, TOC, oxygen uptake rate, and suspended solids were measured to provide comparative and supportive information. Preliminary tests in which ATP measurements of biomass were used to control the percent sludge return were conducted at two full-scale municipal sewage treatment plants. Lowered return sludge rates were found to produce effective treatment and increase the biological activity of the sludge. Results can be obtained within approximately ten minutes. (Author)

WASTE WOOL AS A SCAVENGER FOR MERCURY POLLUTION IN WATERS,
Joseph P. Tratnyek. Apr 72, 47p W72-12008, EPA-16080-HUB-04/72
Paper copy available from GPO $0.60 as EPA 16080 HUB 04/72.

Descriptors: (*Mercury, *Adsorptivity), (*Wool, *Adsorption), (*Water pollution, Mercury), Industrial wastes, Feasibility, Utilization, Sediments, Nylon fibers, Inorganic sulfides, Mercury organic compounds, Mercury inorganic compounds, pH, Fibers.
Identifiers: *Water pollution control.

Laboratory studies demonstrated the feasibility of using waste wool and wool/polyester blend fibers to remove mercury pollution from waters and bottom deposits. Nylon fiber was shown to have limited potential. Within 24 hours, 90-95% of mercury at the 1-ppm level was removed by the wool fiber. At higher levels of mercury, larger quantities were removed, but the percentage decreased. Changes in pH (2 to 10) and temperature (5 to 35 C) did not markedly alter efficacy of wool, nor did anaerobic conditions or variation in water hardness. However, the presence of sulfide in water or sediment reduced effectiveness of wool. Sources of mercury were mercuric chloride, methyl mercuric chloride, phenyl mercuric acetate, bis (2-methoxyethyl) mercury, and dissolved metallic mercury.

Identifiers: *Petrochemical industry, Biological industrial waste treatment, Aeration ponds.

Bench, semi-pilot, and pilot-scale studies of three anaerobic treatment processes have shown the anaerobic lagoon to be both the performance and economic choice for pretreatment of petrochemical wastes in warm, spacious locations. Semi-pilot scale studies of anaerobic contact digesters and packed-bed reactors indicated performance problems when treating actual petrochemical wastes. Experimental data from several sources were combined to prepare a design procedure for anaerobic lagoon pretreatment systems. Operation of a large (30 gpm) pilot plant consisting of anaerobic lagoons followed by aerated stabilization and facultative ponds provided a BOD removal from the petrochemical wastes of greater than 90% and a resistance to both organic-loading and pH shocks. Comparison of an anaerobic-aerobic system with a strictly aerobic system pointed out an economic advantage with the series system due to lower sludge-disposal and oxygen requirements. (Author)

BIOLOGICAL CONCEPTS FOR DESIGN AND OPERATION OF THE ACTIVATED SLUDGE PROCESS.
Water pollution control research series,
Anthony F. Gaudy, Jr., and Elizabeth T. Gaudy. Sep 71, 156p W72-12011, EPA-17090-FQJ-09/71
Paper copy available from GPO $1.25 as EPA17090FQJ09/71.

Descriptors: (*Activated sludge process, *Reviews), (*Sewage treatment, activated sludge process), Design criteria, Biochemical oxygen demand, Dissolved organic matter, Metabolism, Kinetics, Microorganism control (Sewage), Nutrients, Aeration, Oxidation, Mathematical models.
Identifiers: Chemical oxygen demand.

Over the past decade, research has been conducted to produce a general body of conceptual principles applicable to design and operation of activated sludge processes. The aid of the report is to present these biological concepts in terms readily understood by engineering professionals. Generalized concepts of BOD exertion, the use of the measure of biologically available organic matter in a waste sample as a design and operational tool, the stoichiometry and mass balance concepts of treatment, and kinetic equations for microbial growth are presented. Design models are discussed, and a model for completely mixed reactors holding recycle solids, X (R), constant is recommended. Some guidelines for accommodation of various types of shock loadings are included. Concepts of oxidative assimilation and tmhe multiple effects of solids concentration, nitrogen concentration, and detention time are related; a new activated sludge process (continuous oxidative assimilation) for nitrogen-deficient wastes is presented. Data supporting the concept of total oxidation are presented. Some possible flow diagrams for complete aerobic treatment (purification and sludge disposal) of metabolizable organic wastes are presented.

Paper copy available from GPO $2.00 as EPA 17090 DAN 10/71.

Descriptors: (*Sewage treatment, *Economic factors), (*Manpower, Sewage treatment), Cost estimates, Operating costs, Capitalized costs, Cost comparison, Maintenance, Lagoons (Ponds), Construction costs, Sanitary engineers.
Identifiers: Aeration ponds.

Data for estimating average construction costs, operation and maintenance costs, and manpower staffing requirements, are presented for conventional wastewater treatment plants ranging from 1 to 100 mgd in capacity, and for stabilization ponds ranging from 0. 1 to 10 mgd in capacity. Estimating data are included for 21 separate components of conventional plants and 6 separate components of stabilization ponds. Examples of use of the data are given. Estimated average construction costs and operation and maintenance costs are related graphically to appropriate single parameters for respective plant components. Occupation descriptions for 24 job titles related to wastewater treatment, developed in accordance with standards of

the Dictionary of Occupational Titles, are included. The data presented provide means of estimating costs and staffing requirements for a variety of conventional wastewater treatment facilities on an average basis, but do not supplant the need for detailed study of local conditions or recognition of changing design requirements in preparing estimates for specific application. Descriptors: (*Sewage filtration, Overflows), (*Sewage treatment, Sewage filtration), (*Combined sewers, Overflows), Pilot plants, Performance evaluation, Size screening, Drum filters, Industrial wastes, Suspended sediments, Biochemical oxygen demand, Cost estimates, Operating costs, Capital costs, Field tests, Surface water runoff.
Identifiers: Storm water runoff.

Pilot plant studies were conducted to develop and demonstrate the capabilities of the deep bed, dual media, high rate filtrate treatment process for storm caused combined sewer overflows. The treatment system is comprised of a drum screen with a 40 mesh screening element (420 microns opening) followed by a deep bed, dual media, high rate filter of five feet of No. 3 anthracite (effective size 4 mm) over three feet of No. 612 Sand (effective size 2 mm). The results show suspended solids removals of 93 percent, with polyelectrolyte addition, at a filtration rate of 24 gpm/sq ft at an average influent suspended solids of 411 mg/l. Reductions in biochemical oxygen demand averaged 65 percent. Capital costs and operating costs for a high rate filtration plant are given. Principal advantages of the proposed system are: high treatment efficiencies, automated operation, and limited space requirements as compared with alternate flotation or sedimentation systems.

Identifiers: Brine disposal, Dissolved solids, Liquid waste disposal.

An investigation to determine the ground water pollution problems which exist in the states of Arizona, California, Nevada, and Utah was conducted. Data were obtained through an extensive review of the literature and through interviews with engineers, scientists, and governmental officials concerned with water pollution in the four states of the project area. Mineralization of ground water is the most prevalent factor in the degradation of ground water quality in the project area. Large quantities of ground water in each of the four states are undesirable for many uses because of excessive mineralization. Much of the mineralization of ground water is a result of natural processes. A listing of conditions causing ground water pollution in the project area is included.

Identifiers: River Basin Model, *Water pollution abatement.

The River Basin Model is a man-machine simulation model used to delineate the interactions taking place, within a real or hypothetical area, between the local water system and the economic, social and governmental activities of that area; it is a model of an entire regional system, with water a subsystem realistically interacting with all the other major subsystems, such as transportation and housing. Using a gaming format, the model is a computer assisted decision-making tool. The Governmental Sector and the model required by its Planning and Zoning Department, and the computer printed output are described. A principal function of the Governmental Sector is to provide public services, and its participants are elected and appointed public officials. The Planning and Zoning Department affects land use decisions through its power of zoning; it provides adequate parkland and public institutional land (developed parkland--museums, zoos, libraries, public golf courses, etc.) for the local jurisdiction population.

Contract EPA-14-12-959
Paper copy available from GPO $1.00 as EP2.10:16110-FRU-12/71-14.

Descriptors: (*River basin development, Decision making), (*Regional planning, River basin development), (*Transportation, River basin development), Computerized simulation, Interactions, Gaming models, Water resources, Water quality, Allocations, Government policies, Local government, Economic analysis, Demography, Socioeconomic status, Management planning, Bus lines, Rail transportation.
Identifiers: River Basin Model, *Water pollution abatement.

The River Basin Model is a man-machine simulation model used to delineate the interactions taking place, within a real or hypothetical area, between the local water system and the economic, social and governmental activities of that area; it is a model of an entire regional system, with water a subsystem realistically interacting with all the other major subsystems, such as housing and transportation. A gaming format is employed. The Governmental Sector (provides public services) and the model required by its bus and rail companies, and the computer printed output are described. The Governmental Sector establishes the amount of transit service, sets fares, and constructs rail lines and stations. Bus and rail companies provide the population in the simulated area with transportation service to be used for the trip to full-time work only; routes and modes of travel are assigned by the computer program. A social decision-maker assigns a dollar value for a time unit spent travelling to work by the people in his control.

CHANGES IN WATER QUALITY RESULTING FROM IMPOUNDMENT.
Water Pollution Control Research Series,
William R. Duffer, and Curtis C. Harlin, Jr. Aug 71, 103p W72-12072, EPA-16080-GGH-08/71
Paper copy available from GPO $1.25.

Descriptors: (*Stream pollution, Reservoirs), (*Water quality, *Reservoirs), (*Dams, Water quality), Water analysis, Aquatic microbiology, Stratification, Temperature gradients, Seasonal variations, Dissolved gases, Oxygen, Biochemical oxygen demand, Sewage.
Identifiers: Sewage treatment effluents, Impoundments.

Changes in stream water quality, resulting from recent impoundment, are presented and discussed. Extensive data reflecting pre- and post-impoundment conditions were statistically analyzed. The extent to which pollutants influence changes in water quality was minimal, as the drainage basin was relatively undisturbed by the activities of man. Chemical, physical, and microbiological parameters at stream stations were evaluated for three discrete periods of time: prior to closure of the dam, during filling of the active conservation pool, and following filling with the surface maintained near the top of the active conservation elevation. Effects of removing treated municipal waste effluents from a tributary were also evaluated. Water quality changes within the impound-

ment were compared with respect to season, year, station location, and depth of sampling. Critical factors in the impoundment, which contributed to water quality changes, are identified. (Author)

THE EFFECT OF CHLORINATION ON SELECTED ORGANIC CHEMICALS.
Water pollution control research series,
E. L. Barnhart, and G. R. Campbell. Mar 72, 105p W72-12074, EPA-12020-EXG-03/72
Paper copy available from GPO $1.00.

Descriptors: (*Chlorination, Organic compounds), (*Sewage treatment, Chlorination), (*Chlorine organic compounds, *Biodeterioration), (*Water pollution, Chlorine organic compounds), Industrial wastes, Gas chromatography, Activated sludge process, Bioassay, Decomposition reactions, Toxicology, Alcohols, Acetone, Aromatic compounds, Phenols, Amines, Nitro compounds, Fishes, Aquatic microbiology, Biochemical oxygen demand.
Identifiers: Chemical oxygen demand, Water pollution effects (Plants), Water pollution effects (Animals).

Fourteen industrial organic chemicals were examined for their persistence through biological treatment, either as the initial compounds, or as degradation products. Semi-continuous activated sludge systems were employed. The ability of each of the chemicals to participate in reactions with free chlorine was then determined in a series of batch experiments. Certain of the test compounds formed persistent degradation products during treatment. Five of the initial compounds reacted readily with chlorine, under conditions commonly employed in effluent chlorination. Five of the chlorination products were further studied in respirometer experiments to evaluate their persistence in mixed microbial systems. Their toxicity to fish was determined using the static bioassay procedure. A series of bench scale, continuous flow ecosystems were established for the evaluation of longer term effects of three of the chlorination products. Several varieties of organisms, representing different levels in the food chain, were studied.

FLUIDIZED-BED INCINERATION OF SELECTED CARBONACEOUS INDUSTRIAL WASTES.
Water pollution control research series.

Mar 72, 92p W72-12075, EPA-12120-FYF-03/72
Paper copy available from GPO $1.00 as EPA12120FYF03/72.

Descriptors: (*Industrial waste treatment, *Incinerators), (*Sludge disposal, Incinerators), (*Rubber industry, Industrial waste treatment), (*Textile industry, Industrial waste treatment), (*Fluidized bed processors, Incinerators), Paints, Plastics, Elastomers, Design, Air pollution, Combustion products, Cost estimates, Water pollution, Industrial wastes, Carbon, Ohio, Performance evaluation, Waste disposal, Abatement.
Identifiers: *Solid waste disposal, *Water pollution abatement, *Paint industry.

The feasibility of fluidized-bed incineration for selected carbonaceous industrial wastes was evaluated. The two-phase program consisted of an initial phase in which wastes from the paint, plastics, rubber, and textile industries in Ohio were characterized, and a second phase in which various waste samples were obtained, analyzed, and experimentally incinerated in a 10 inch diameter fluidized-bed system. Results indicate that sludges from solvent recovery operations in the paint industry, sludges from primary treatment of process wastes from plastic manufacturing, flotation sludges from primary treatment of synthetic rubber manufacture, and the waste from the viscose process of the textile industry can be incinerated in a fluidized-bed system without the production of noxious or toxic exhaust gases. The program also indicates that incineration of the various wastes significantly reduces their potential impact on stream pollution. (Author)

RENOVATING SECONDARY SEWAGE BY GROUND WATER RECHARGE WITH INFILTRATION BASINS.
Water pollution control research series,
Herman Bouwer, R. C. Rice, E. D. Escarcega, and M. S. Riggs. Mar 72, 103p W72-12071, EPA-16060-DRV-03/72
Paper copy available from GPO $1.00 as EPA16060DRV03/72.

Descriptors: (*Ground water recharge, *Sewage disposal), Aquifers, Hydrology, Feasibility, Fluid infiltration, Cost estimates, Nutrients, Fluorides, Boron, Phosphorus, Nitrogen, Irrigation.
Identifiers: Sewage treatment effluent, Sewage irrigation, *Water pollution control.

A field project demonstrated the feasibility of renovating secondary sewage effluent by ground water recharge with infiltration basins. Maximum loading rates were obtained. With the schedules the system could infiltrate 300-400 ft/year using a water depth of 1 ft. Grassed basins had higher infiltration rates, and a gravel covered basin had a lower infiltration rate than a bare soil basin. Essentially complete removal of BOD and fecal coliform, and significant removal of phosphorus, nitrogen and fluoride were obtained. Hydraulic properties of the aquifer were evaluated by analog from the response of piezometric heads in the ground-water system to infiltration. These properties were then used in the design of a prototype system, which would yield renovated water at an estimated total cost of about $5 per acre-foot at the pump. (Author)

SAND AND GRAVEL OVERLAY FOR CONTROL OF MERCURY IN SEDIMENTS.
Water pollution control research series,
Leonard H. Bongers, and Mohammed N. Khattak. Jan 72, 46p W72-12069, EPA-16080-HVA-01/72
Paper copy available from GPO $0.55 as EPA16080HVA01/72.

Descriptors: (*Sediments, *Mercury), (*Water pollution, Mercury), Covering, Releasing, Desorption, Control, Mercury organic compounds, Sands, Gravel, Aerobic processes, Anaerobic processes, Cost estimates, Feasibility.
Identifiers: *Water pollution control.

The release of toxic mercurials by mercury-enriched river sediments was examined in the laboratory. Tests showed a release of 1 micro g of methylmercury per sq m, per day. Methylmercury occurred in sediments with low and with high organic content, in sediments with low and high cation exchange capacity, and in aerobic and anaerobic sediments. The release of toxic mercury could be prevented by a layer of sand, 6 cm in thickness, applied over the mercury-enriched sediments. Layers of fine or coarse gravel (6 cm deep) were as effective as sand. A slow release of metallic mercury occurred in aerobic sediments. The release was much faster in anaerobic sediments. Using ascorbate as an artificial electron donor, metallic mercury could be released at high rates from aerobic sediments as well. Ascorbate appeared to be a useful indicator of divalent and biologically accessible mercury. The laboratory investigations proved the soundness of the sand blanket approach. Costs are given. NITRATE IN THE UNSATURATED ZONE UNDER AGRICULTURAL LANDS.
Water pollution control research series,
P. F. Pratt. Apr 72, 45p W72-12042, EPA-16060-DOE-04/72
Paper copy available from GPO $0.55.

Descriptors: (*Water pollution, *Nitrates), (*Ground water, Nitrates), (*Fertilizing, Water pollution), Leaching, Irrigation, Hydrology, Citrus trees, Farm crops, Concentration (Composition), Denitration, Fertilizers, Water quality, Nutrients.
Identifiers: Water pollution abatement.

Because of a tremendous increase in the concern for nitrate (NO3 (-)) in surface and ground waters, the study of NO3 (-) leaching has become very important. The present investigation was undertaken to determine the potential contribution of fertilizer N use on citrus and row crops to the NO3 (-) in ground waters in the Santa Ana River Basin of Southern California where a deep unsaturated zone exists between the soil profile or crop-root zone and the water table or saturated zone. The objectives were to relate NO3 (-) concentrations in the unsaturated zone to N inputs, N removal by harvested crops and the volume of drainage water, to obtain some estimates of transit times for drainage water through the unsaturated zone, to estimate denitrification losses on a field basis, and to assess the probable effects of present fertilizer N recommendations on NO3 (-) in ground waters.

Water pollution control research series.

Dec 71, 167p W72-12109, EPA-18050-DBB-12/71
Paper copy available from GPO $1.50 as EPA18050DBB12/71.

Descriptors: (*Water pollution, *Ecology), (*Texas, Water pollution), Bioassay, Benthos, Toxicology, Industrial wastes, Sewage, Water quality, Fishes, Minnows, Nutrients, Biochemical oxygen demand, Nitrogen, Phosphorus, Metals.
Identifiers: *Tarrant County (Texas), Trinity River, Sewage treatment effluent, *Fort Worth (Texas), Water pollution effects (Animals), Chemical oxygen demand.

Toxicity of industrial effluents discharged directly into or in close proximity to the Trinity River (Tarrant County, Texas) was investigated through a 27-month period. The investigation was concerned with four aspects--bioassay, growth and development, chemistry, and benthos. Three industries contributed toxic materials which had a significant influence on the surrounding aquatic community. Toxicity ranges were established for the respective effluents using mature minnows, fry and spawn. Effluents from a railroad equipment cleaning area, a plant producing cracking catalysts used in processing combustion engine fuels, and a sewage treatment plant influenced the water quality of the river downstream from the outfalls. The ranges of nitrates, phosphates, biochemical oxygen demand and specific conductance for the river were increased by the effluents.

Identifiers: *Water pollution effects (Animals), *Water pollution effects (Plants), *Brine disposal, Liquid waste disposal, Thermal pollution, Key West (Florida), Serpulidae.

An eighteen month biological study showed the heated brine effluent from a desalination plant in Key West, Florida caused a marked reduction in biotic diversity. Some organisms were more abundant in the receiving waters than in control areas but these were generally capable of isolating themselves from the effluent by closing up or by moving to other areas during periods of high contamination. Ionic copper, discharged from the plant, was the most toxic feature of the effluent. Temperature and salinity of the effluent and the receiving water were such that the effluent stratified at the bottom of the receiving basin. Periodically, the plant shut down for maintenance or cleaning. When it resumed operations, low temperature water of ambient salinity was discharged which was highly contaminated with ionic copper. These sudden effusions caused more biological damage than steady-state conditions. At the end of the study, extensive engineering changes were made to correct corrosion problems and lower copper discharge. (Author)

REVERSE OSMOSIS CONCENTRATION OF DILUTE PULP AND PAPER EFFLUENTS.
Water pollution control research series,
Averill J. Wiley, George A. Dubey, and I. K. Bansal. Feb 72, 369p W72-12189, EPA-12040-EEL-02/72
Prepared in cooperation with Institute of Paper Chemistry, Appleton, Wis.
Paper copy available from GPO $2.75.

Descriptors: (*Industrial waste treatment, *Osmosis), (*Paper industry, Industrial waste treatment), Performance evaluation, Spent liquors (Pulping), Suspended sediments, Flux (Rate), Maintainability, Pilot plants, Fouling, Cost estimates, Concentrating, Water reclamation, Industrial wastes, Design criteria, Calcium.
Identifiers: *Reverse osmosis, *Water pollution control, Tubular membranes, Spiral wound membranes, Hollow tube membranes, Waste water reuse.

Adaptation of reverse osmosis (RO) as a method of concentration for dilute effluents of pulping, bleaching, and paper manufacture was conducted in laboratory, pilot scale, and in large 50,000 gallon per day field demonstrations at pulp mills. Most of these dilute wastes at 1 percent solids contained suspended particles, colloidal suspensoids, large molecular-weight wood derived organics, and/or scale-forming inorganic chemical residues. Tubular membrane systems capable of being operated at self-cleaning velocities increasing beyond 2.0 feet per second, as concentration advanced to 10 percent solids, were apparently best adapted to processing these effluents at sustained high flux rates and relatively free of fouling problems. Capillary fiber and spiral wound sheet membrane systems required expensive clarification treatment. Tubular systems studied were subject to excessive failure rates in terms of life of membrane support structures or to leakage of internal connections based on the support structure. (Author)

LAKE SUPERIOR PERIPHYTON IN RELATION TO WATER QUALITY.
Water pollution control research series,
Theodore A. Olson, and Thoren O. Odlaug. Feb 72, 269p W72-12192, EPA-18050-DBM-02/72
Paper copy available from GPO $2.00.

Descriptors: (*Aquatic microbiology, *Great Lakes), (*Biological surveys, Great Lakes), Primary biological productivity, Limnology, Ecology, Nutrients, Luminous intensity, Substrates, Rocks, Algae, Photosynthesis, Chlorophyll, Diatoms, Chrysophyta, Chlorophyta, Cyanophyta, Water quality.
Identifiers: *Periphyton, *Lake Superior.

Laboratory and field studies were conducted to evaluate the importance of periphyton in western Lake Superior with special reference to the make-up and distribution of the periphyton growths and to the overall importance of productive capacity of this assemblage of organisms. The taxonomic portion of the investigation indicated that over 90% of the total number of organisms were diatoms and that the phyla to which these diatoms belonged were the Chrysophyta, the Chlorophyta, and the Cyanophyta. Predominant genera were Synedra, Achnanthes, Navicula, Cymbella, and Gomphonema. In many respects, the periphyton of Lake Superior was similar to that found in streams and there was evidence that the interrelated factors that affected periphyton growths were temperature, light intensity, depth of water, water movements, nutrient levels, and the type of substrate. ISOLATION OF LYTIC AGENTS RELATED TO SPHAEROTILUS,
Dorothy J. Geason. Sep 70, 26p W72-12120, FWPCA-17050-DHI-09/70

Descriptors: (*Sphaerotilus, Bacteriocides), (*Aquatic microbiology, Sphaerotilus), (*Ecology, Sphaerotilus), Water quality, Sewage, Aerobic bacteria, Rivers, Myxococcaceae, Water pollution.
Identifiers: *Lysis, Bdellovibrio bacteriovorus, Sporocytophaga, Water pollution effects (Plants).

The study has been undertaken to isolate and identify those agents found in nature which are capable of lysing Sphaerotilus and thus abate the nuisance associated with its occurrence in flowing streams and raw sewage. Enrichment culture of river water or raw sewage and either a locally isolated strain or ATCC 13336 has resulted in the isolation of four bacteria capable of destroying the cells but not the sheath of Sphaerotilus. Bdellovibrio bacteriovorus first appeared as small motile rods causing spheroplasting and lysis of the host. Two other isolates were gram-negative rods which formed microcysts but not fruiting bodies. These have been tentatively identified as myxobacters of the genus Sporocytophaga. The fourth isolate is also a gram-negative rod.

EVALUATION OF PROCESSES AVAILABLE FOR REMOVAL OF PHOSPHORUS FROM WASTEWATER.

Oct 71, 44p* W72-12121, EPA-R2-72-034
Contract FWQA-14-12-581

Descriptors: (*Chemical removal (Sewage treatment), *Phosphorus), (*Precipitation (Chemistry), Phosphorus), (*Sewage treatment, Chemical removal (Sewage treatment)), Phosphates, Sludge disposal, Performance evaluation, Cost estimates, Calcium oxides, Aluminum sulfate, Iron sulfate, Electrochemistry, Solubility, Sludge digestion, Aerobic processes, Sludge drying, Activated sludge process, Digestion (Decomposition), Capital costs, Operating costs, Incinerators.
Identifiers: Tertiary sewage treatment.

The more important treatment processes for removal of phosphorus compounds from municipal wastewater are evaluated for practicality, cost, and impact on the quality of the treated effluent. The numerous options for the designer in the selection of treating processes, chemicals to be used, and the point or points of chemical application are discussed. A detailed list of phosphorus removal projects of one consulting engineer is given as an example of phosphorus removal projects under design. A list of full-scale phosphorus removal plants, already in operation or planned, shows the type of treatment selected and the operating results expected. Various methods of ultimate sludge disposal are discussed. (Author)

Descriptors: (*Mercury, *Gas sampling), (*Air pollution, Mercury), Flue gases, Field tests, Smelters, Zinc, Errors, Sulfur dioxide, Spectrochemical analysis, Atomic spectroscopy, Mercury amalgams, Gold alloys, Trace elements, Gas analysis, Metal industry.
Identifiers: *Air pollution detection, Zinc industry.

The research described concerns field tests for the adaption of the gold amalgamation sampling procedure for the collection of mercury in gas streams having high SO2 concentrations. This method, which was described in PB-210 817, consists of removing volatile mercury from the gas stream by amalgamating it on gold foil. The gold amalgam sampling and analytical procedure developed for power plants was directly amenable to the zinc smelter investigated. SO2 concentrations as high as 7.5% did not affect the sampling and analytical procedure. When using a stannous chloride or distilled water scrubber during one minute runs over a wide range of flow rates reproducible results were obtained with a 95% plus recovery on the first amalgamator. The stability of the mercury-gold amalgam depends on the temperature of the gas stream. The major problem was the high sensitivity of the analytical procedure resulting in a very short sampling period. (Author)

STUDY OF AIR POLLUTION ASPECTS OF VARIOUS ROADWAY CONFIGURATIONS.
Final rept.

1 Sep 71, 211p* APTD-1146
Contract CPA-22-69-135

Descriptors: (*Air pollution, *Exhaust gases), (*Highway planning, Air pollution), (*Urban areas, Air pollution), Atmospheric diffusion, Mathematical models, Design criteria, Streets, Concentration (Composition), Carbon monoxide, Particles, Oxidizers, Nitrogen oxides, Standards, New York, Diurinal variations, Wind (Meteorology).
Identifiers: *Automobile exhaust, Clean Air Act 1970, New York City (New York), Air pollution standards.

The experimental study was undertaken to: Ascertain the current air quality in the immediate vicinity of various urban roadway configurations; Determine how the selected urban roadway configurations aid or hinder the diffusion of the pollutants emitted by urban traffic; and Develop mathematical relationships between traffic, traffic speed, pollutant concentration, meteorological parameters and roadway configuration. It is possi-

ble for urban and transportation planners to compute in advance the pollution anticipated for a proposed roadway design in order to insure that dwellings adjacent to the proposed design will not be exposed to pollutant concentrations in excess of the National Air Quality Standards. Ten urban roadway configurations were evaluated: Covered on top-open at side; Long tunnel (ventilated; Shallow cut; Short tunnel (unventilated); Deep cut; Grade road; Cantilever cover; Viaduct; City street; and Intermittent span. All of the testing locations were in New York City.

Descriptors: (*Sewage treatment, *Flocculating), (*Flocculants, *Polyelectrolytes), Polymers, Sedimentation, Precipitation (Chemistry), Performance evaluation, Optimization, Suspended sediments, Elutriation, Sludge disposal, Biochemical oxygen demand.

High molecular-weight organic polyelectrolytes (polymers) have been used successfully to flocculate raw wastewater and to increase the removal of pollutants from the wastewater during primary sedimentation. At present, however, a satisfactory method for predicting the effectiveness of a particular polymer for flocculating solids in a specific wastewater is not available. Three polymers, Dow's anionic A-21 modified with cationic C-31, Hercules' cationic Reten 210, and Calgon's anionic ST 269 with a clay builder, were added to raw wastewater in 240 MGD tests of raw wastewater flocculation. The objectives of polymer flocculation of the raw wastewater were to increase solid capture in the primary tanks, reduce the BOD load to aeration, and permit recycle of the elutriate to the plant's influent. Polymer treatment of raw wastewater did not improve the solids capture in elutriation or permit continuous elutriate recycle.

Identifiers: *Water pollution control, *Feedlot wastes, Manure, Aeration ponds, Anaerobic lagoons, Solid waste disposal, Liquid waste disposal, Sewage irrigation.

Alternative beef waste management systems were examined to determine minimum cost systems for effective waste disposal. Design and cost information was obtained from feedlot visits and the literature. A computer program was developed for use with a Conversational Programming System (CPS) for calculating the sizes of equipment and facilities and for estimating the facility and machinery operating and investment costs. For open feedlots, two waste management systems, solid and runoff-carried, were considered. Costs are given. Confinement buildings with slotted floors using slurry handling methods or with solid floors using solid handling methods offer a high potential for completely controlling the animal waste and abating pollution. A promising system for near optimum pollution control is a cable scraper system underneath a slotted floor for daily removal and disposal of the wastes. A manure irrigation is discussed.

HYPOCHLORITE GENERATOR FOR TREATMENT OF COMBINED SEWER OVERFLOWS.
Water pollution control research series.

Mar 72, 91p W72-12280, EPA-11023-DAA-03/72
Contract FWPCA-14-12-490
Paper copy available from GPO $1.00 as EP2.10:11023DAA 03/72.

Descriptors: (*Hypochlorites, Production), (*Sewage treatment, *Disinfection), (*Electrolytic cells, Hypochlorites), Overflows, Sodium hypochlorites, Gas generators, Salt water, Chlorine, Chlorination, Sodium hydroxide, Ion exchange resines, Performance evaluation, Cost estimates, Combined sewers, Design criteria.
Identifiers: Storm water runoff.

An advanced electrolytic generator has been developed for on-site production of sodium hypochlorite for disinfection of overflows from combined sewer systems. In the system an electrochemical cell electrolyzes sodium chloride brine to chlorine gas and sodium hydroxide solution, which are reacted immediately outside the cell to produce a 5 to 10% sodium hypochlorite solution. Significant advances in safety and economy have been realized by use of a hydraulically impermeable cation exchange membrane. The most critical components, the dimensionally stable anode and the ion-exchange membrane, have both operated for over 3000 hours with no deterioration of performance. System operation has been given a first order economic optimization. The cost is significantly below that of truck delivered solution. Such economy of operation should make the generator useful for a wide variety of water treatment applications. (Author)

FILTRATION OF MUNICIPAL WASTE WITH A MOVING BED CONTACTOR.
Water pollution control research series,
F. O. Mixon. Jan 72, 51p W72-12281, EPA-17030-FWH-01/72
Contract FWPCA-14-12-895
Paper copy available from GPO $0.60 as EP2.10: 17030 FWH 01/72.

Descriptors: (*Sewage filtration, *Contactors), (*Sewage treatment, Sewage filtration), Performance evaluation, Trickling filtration, Suspended sediments, Cost estimates, Capital costs, Operating costs, Coagulation.
Identifiers: Moving bed contactor filtration.

A novel moving bed contactor has been used in filtration studies of municipal waste at various stages within a trickling filter plant. Granular, buoyant filter medium is slurried with process feed and introduced to the bottom of a column equipped with lateral retaining screens and filter medium harvesting machinery, both positioned toward the top of the column. Within the column, filter medium rises by buoyancy and forms a porous plug that traps suspended solids from the feed stream. Filtered liquid is removed from the lateral screen, and soiled filter medium is continuously removed from the column top, washed and recycled to the column bottom. The process operates stably and dependably on all feeds tested--raw wastewater, primary clarifier effluent, [illegible]ckling filter effluent. Filtration of alum-coagulated feed is less effective than that of untreated feed. Costs of the process, including equipment, power, construction, and amortization, were estimated. (Author)

Paper copy available from GPO $0.60 as EP2.10:12060-EOE-01/72.

Descriptors: (*Textile industry, *Industrial waste treatment), (*Sizing materials, Industrial waste treatment), Performance evaluation, Carboxymethyl cellulose, Polyvinyl alcohol, Biochemical oxygen demand, Precipitation (Chemistry), Coagulation, Cost estimates, Water pollution, Activated sludge process, Aluminum sulfate, Alums.
Identifiers: *Water pollution control, Biochemical industrial waste treatment.

Removal of the size with which the warp (lengthwise) yarns are coated to make the weaving of the fabric possible is a common operation in the preparation of cloth for dyeing and finishing. Processes for precipitating from desizing wastes the synthetic warp sizes, carboxymethyl cellulose (CMC) and polyvinyl alcohol (PVA), were investigated. Cycles of sizing, desizing and size recovery were performed on cotton-polyester (65:35) yarns, starting with commercial CMC, and continuing with only the recovered material. Two copolymers of PVA were prepared, one of which was precipitated from dilute solution by aluminum sulfate and ferric chloride, the other by acidification. Evidence was obtained that acclimatization of sewage bacteria to CMC and PVA occurs upon prolonged contact in a laboratory activated-sludge unit. Costs are discussed.

Contract FWPCA-14-12-569
Paper copy available from GPO $1.00 as EP2.10:17070-DRP-12/70.

Descriptors: (*Sludge, *Biomass), (*Anaerobic bacteria, Counting), (*Sewage treatment, Anaerobic bacteria), Anaerobic processes, Sludge digestion, Methane, Performance evaluation, Culture media, Sampling, Microbiology.
Identifiers: Methane bacteria.

The research program was initiated to develop practical methods for evaluation of the biomass in anaerobic sewage sludge and to determine if predictions could be made concerning digester performance. Sampling and handling methods were improved and standardized to give maximum anaerobic counts. A simplified technique for growing obligate anaerobes that can be safely performed by technicians with minimum training in bacteriology was developed. Anaerobic media were improved to yield as high or higher counts of methanogenic bacteria than heretofore reported. A simple freeze-dry technique was developed for preparation of consistent batches of sludge supernatant used in media as a supplement for growth of obligate sludge anaerobes. The possible relationship between concentration of a growth factor required by Methanobacterium ruminantium (used to evaluate potency of growth factor extracted) and digester efficiency could have important practical implications. MERCURY POLLUTION CONTROL IN STREAM AND LAKE SEDIMENTS.
Water pollution control research series,
J. D. Suggs, D. H. Petersen, and J. B. Middlebrook, Jr. Mar 72, 39p* W72-12070, EPA-16080-HTD-03/72
Contract EPA-68-01-0086
Paper copy also available from GPO $0.50 as EPA-16080-HTD-03-72.

Descriptors: (*Water pollution, Mercury), (*Mercury, *Chemisorption), (*Water chemistry, Mercury), (*Sediments, Mercury), Precipitation (Chemistry), Mercury organic compounds, Mercury inorganic compounds, Adsorption, Thiols, Polyvinyl alcohol, Substrates, Performance evaluation, Thioureas, Cotton fabrics, pH, Dissolved gases, Oxygen.
Identifiers: *Water pollution control.

Mercury contamination enters streams and lakes from a variety of sources. It becomes sorbed onto the sediments where it resides in dynamic equilibrium with the dissolved species in the suprajacent water column. A means must be found to remove mercury from sediments without destroying the environment or otherwise upsetting the ecological balance. The problem of mercury immobilization and removal was addressed by evaluating a number of recoverable sulfur based getter systems. Examples of these are: Elemental sulfur deployed as a coating on a recoverable meshwork, and Thiourea type organic compounds dispersed in a recoverable matrix. In the course of these evaluations several improved getter system combinations became obvious and these were also included into the scope of this research. Only natural sediments and waters were used to prepare test aquaria in order to simulate natural conditions as nearly as possible.

Missouri River Basin Animal Waste Management Pilot (Steering) Task Group, Kansas City.
FEEDLOT WASTE MANAGEMENT. WHY AND HOW.
Final rept.

Jun 71, 50p

Descriptors: (*Water pollution, *Agricultural wastes), (*Beef cattle, Agricultural wastes), Reviews, Agricultural engineering, Surface water runoff, Ground water, Air pollution, Dust control, Odor control, Biodeterioration, Site surveys, Management, Lagoons (Ponds), State government, Regulations.
Identifiers: *Feedlot wastes, Manure, *Water pollution control.

Basic information on the problem of beef cattle feedlot waste management and the pollution arising from these operations is presented in a non-technical manner. The factors that cause feedlots to pollute and the magnitudes pollutants may reach are discussed along with some management factors and structural and mechanical means to help control water pollution. Sources of technical and financial assistance in design and layout of control facilities and the water pollution control agencies for the ten Missouri River Basin states are listed. Existing animal waste control regulations are also furnished for these ten states.

Contract PH-14-12-547
Paper copy available from GPO $1.50 as EP2.10:17070-EBP-07/71.

Descriptors: (*Sludge disposal, Incinerators), (*Openhearth furnaces, Sludge disposal), (*Incinerators, Computerized simulation), Design criteria, Computer programs, Waste disposal, Cost estimates, Fuel consumption, Labor estimates, Heat balance, Combustion products, Scrubbers, Air pollution control equipment, Furnaces, Capital costs, Operating costs.
Identifiers: *Solid waste disposal.

A digital computer program was developed for the preliminary design and cost estimation of an optimum multiple-hearth-furnace system for sewage sludge incineration. The program was primarily based on field data from nine operating plants, each having one to four furnaces. The individual furnaces covered a range in capacity from 200 to 4500 lb dry solids per hours. Operating schedules and thermal cycling were considered, and costs were normalized to 1969 dollars. The computer program provides the number, dimensions and ratings of components; expenditures of labor, fuel and power; and all the cost elements for an incineration system which is to process a given flow of sludge having specified characteristics. Cost breakdowns are calculated for capital, total cost per annum and total cost per ton dry solids incinerated. The computer program may also be used for the thermal analysis of a multiple-hearth furnace incinerator without design and cost features.

COLLABORATIVE STUDY OF REFERENCE METHOD FOR THE CONTINUOUS MEASUREMENT OF CARBON MONOXIDE IN THE ATMOSPHERE (NON-DISPERSIVE INFRARED SPECTROMETRY),
Herbert C. McKee, and Ralph E. Childers. May 72, 48p
Contract CPA-70-40

Descriptors: (*Carbon monoxide, *Gas detectors), (*Air pollution, Carbon monoxide), Infrared spectra, Monitors, Spectroscopic analysis, Laboratories, Statistical analysis, Calibration, Standards, Errors, Humidity, Precision, Accuracy.
Identifiers: *Air pollution detection.

Information obtained in the evaluation and collaborative testing of a reference method for measuring the carbon monoxide content of the atmosphere is presented. The method is based on the infrared absorption characteristics of carbon monoxide, using an instrument calibrated with gas mixtures containing known concentrations of carbon monoxide. The method as published in the appended 'Federal Register' article was tested by means of a collaborative test involving a total of 16 laboratories. The test involved the analysis of both dry and humidified mixtures of carbon monoxide and air over the concentration range from 0 to 60 mg/cu m. A statistical analysis of the data of 15 laboratories is presented. (Author)

Identifiers: Pacific Northwest, Thermal pollution, Water pollution effects (Animals), Water pollution effects (Plants).

To answer the environmental questions posed by use of the nearshore area for industrial outfalls, a coastal pollution group was formed to collect, organize, and analyze all oceanographic data which would aid in the evaluation of sites for industrial outfalls on the open coast of the Pacific Northwest. Part I of the report presents a discussion of the physical and geological factors which are known for the region of study. Part II summarizes the knowledge of the chemistry and radiochemistry of the region, and Part III considers the biological aspects with emphasis on temperature relations and attempts to establish some preliminary priorities. Part IV is an attempt to describe the coastal ecosystem by integrating the physical, chemical, geological, and biological information into a general overview. A bibliography with over 3100 references is given.

MULTIDIRECTIONAL TURBULENCE PROBE DEVELOPMENT. PHASE I. UNIDIRECTIONAL TURBULENCE SENSOR DEVELOPMENT.
Water pollution control research series,
Thomas Atterbury, James E. Sorenson, and Jack J. Groom. Oct 71, 66p W72-12453, EPA-16050-DOW-10/71
Contract EPA-14-12-827
Paper copy available from GPO $0.65 as EPA16050DOW10/71.

Descriptors: (*Detectors, Development), (*Water pollution, Monitors), Probes, Turbulence, Velocity, Frequency, Depth, Strain gages, Pressure sensors, Diaphragms (Mechanics).
Identifiers: *Turbulence probes.

Development of a unidirectional-turbulence probe was undertaken to investigate the feasibility of a small-diameter strain-gaged diaphragm-type pressure transducer and a self-adjusting depth compensation air reservoir for use in the follow-on development of a small (1/2-inch diameter) multidirectional-turbulence probe. A unidirectional probe was developed which is capable of monitoring water velocities over a range of 0.5 to 5 ft/sec in turbulence frequencies of 0 to over 100 Hertz and which will automatically operate in water up to 10-feet deep. Sealing inadequacies in both the air reservoir membrane and the pressure diaphragm permit moisture entry into the air volume covering the strain gages. This has given rise to balance drift and circuitry ground problems that have resulted in the placing of limitations on the water exposure and turbulence monitoring times for the unidirectional probe. These problems also suggested that the concepts cannot be immediately incorporated into a multidirectional probe design. (Author)

Contract EPA-80-04-68
Paper copy available from GPO $1.50 as EP2.10:11022DEI05/72.

Descriptors: (*Sewers, Fluid infiltration), Sanitary sewers, Ground water, Construction materials, Sanitary engineering, Cost estimates, Maintenance, Louisiana.
Identifiers: New Orleans (Louisiana), Gulf Coast Region (United States).

Ground water infiltration studies were performed on several sewer systems in 1962-63 and again in 1970 and the results were compared. Infiltration measurements in the systems ranged from zero to 111,560 gallons per inch of diameter per mile per day. The infiltration was slightly increased in some lines and was greatly decreased in others. The decrease is attributed to soil and grease clogging the breaks, as was observed in subsequent television inspection. Infiltration has been found to vary with time. The high infiltration rates were attributed to poor construction methods used by contractors on the main sewer system and by plumbers on house connections. Bedding and backfill material should provide even distribution of load and support for the pipe. The use of these materials and other construction techniques are described.

Mar 71, 270p W7212450, EPA-16130-DNE (03/71)
Contract EPA-14-12-593
Paper copy available from GPO $2.00 as EP2.10:16130DNE03/71.

Descriptors: (*Gas turbine power generation, *Reviews), Performance evaluation, Forecasting, Cost estimates, Electric power generation, Comparison, Thermal power plants, Natural gas, Electric utilities, Capital costs, Operating costs, Industrial water, Cooling water, Heat, Water pollution, Abatement.
Identifiers: Thermal pollution, Water pollution abatement.

Performance, size and cost for advanced simple-, regenerative-, and compound-cycle gas turbine engines were reviewed. For various regions of the U.S., comparisons were made of installed costs and total busbar power costs of a 1000-MW power station using gas turbines versus one using steam turbines. It is shown that the gas turbines in the 1970 decade could produce electric power at lower costs than steam turbines in the South Central U.S. where natural gas is readily available. Elsewhere in the U.S. the gas turbines would be economically competitive if moderately priced clean fuels were available. Advanced gas turbines are expected to become more competitive in the 1980's as anticipated increases in turbine inlet temperature, component efficiencies and larger engine designs lead to more efficient and lower cost engines. Although the development costs for large, advanced gas turbines would approach 100 to 200 million dollars, the total amount that utilities are expected to expend for cooling devices to combat thermal pollution over the next two decades is more than ten times this amount. HEATED SURFACE JET DISCHARGED INTO A FLOWING AMBIENT STREAM.
Water pollution control research series,
Louis H. Motz, and Barry A. Benedict. Mar 71, 219p W72-12451, EPA-16130-FDQ-03/71
Prepared in cooperation with Vanderbilt Univ., Nashville, Tenn.

Descriptors: (*Stream pollution, Mixing), (*Water pollution, Heat), (*Stream flow, Heat), Plumes, Jet mixing flow, Drag, Entrainment, Cooling water, Industrial wastes, Electric power plants, Stratification, Turbulent flow, Site surveys, Mathematical models, Hydraulic models.
Identifiers: *Thermal pollution.

The temperature distribution in the water body due to a discharge of waste heat from a thermal-electrical plant is a function of the hydrodynamic variables of the discharge and the receiving water body. The temperature distribution can be described in terms of a surface jet discharging at some initial angle to the ambient flow and being deflected downstream by the momentum of the ambient velocity. It is assumed that in the vicinity of the surface jet, heat loss to the atmosphere is negligible. It is concluded that the application of the two dimensional surface jet model is dependent on the velocity ratio and the initial angle of discharge, and the value of the initial Richardson number, as low as 0.22. Both laboratory and field data are used for verification of the model which has been developed. Laboratory data were used to evaluate the two needed coefficients, a drag coefficient and an entrainment coefficient, as well as the length of the zone of flow establishment and the angle at the end of that zone.

Identifiers: *Thermal pollution.

A comprehensive analytical model has been developed to describe the flow of heated water from a channel onto the surface of a lake or reservoir. This analytical tool can be used to predict depth, width, temperature, and flow velocity in a heated water surface jet. Weak cross-currents and winds are included. The model also predicts the total amount of heat actually lost to the atmosphere and the amount of ambient water entrained. As presented, the analytical method is simple and inexpensive to apply. It assumes fully established buoyant jet flow into homogeneous environment. It can be extended to include, for example, an outlet zone (zone of flow establishment) or stratification in the ambient water. Criteria for the existence of the two-dimensional mixing internal hydraulic jump and the rates of entrainment which it may produce have been established theoretically and verified with a limited number of experimental data. The results of two field surveys in a thermal plume are presented. (Author)

Descriptors: (*Aquifers, *Water pollution), (*Injection wells, Hydrology), (*Waste disposal, Injection wells), Mixing, Mathematical models, Stratification, Artesian water, Tests, Water flow.
Identifiers: *Liquid waste disposal.

Analytical techniques are given to describe the mixing of two fluids of different density in a confined aquifer, in which one fluid is introduced to the aquifer by well recharge. The immiscible displacement process in both linear and radial flows is analyzed and the effects of longitudinal and lateral dispersion are included using a boundary layer approximation. Hydrodynamic dispersion retards gravity segregation due to density differences. During recharge excellent agreement between the theoretical predictions and experimental results was found, and the predicted retarding effects of longitudinal dispersion were verified. During withdrawal some systematic differences between the theory and observation were noted. Theoretical predictions of recovery efficiency during a recharge-storage-withdrawal sequence show trends similar to those observed. Direct theoretical predictions of recovery efficiency during single or multiple sequences of recharge-storage-withdrawal were developed for an immiscible system, and similar developments outlined for miscible displacement.

Descriptors: (*Sludge disposal, *Incinerators), (*Sewage treatment, Sludge disposal), Fluidized bed processors, Furnaces, Air pollution control equipment, Waste disposal, Air pollution, Water pollution, Oceans, Performance evaluation, Abatement, Metals, Pesticides, Trace elements, Particles, Sulfur dioxide, Nitrogen oxides, Lead, Mercury, Chlorine organic compounds, Scrubbers, Ashes, Combustion products.
Identifiers: *Air pollution control, *Water pollution abatement, *Solid waste disposal, Ocean waste disposal, Biphenyl/chloro.

The report presents the findings of a Task Force which was established to evaluate sludge incineration as an acceptable alternative to ocean disposal. Multiple-hearth and fluidized bed furnaces, containing scrubbing devices for particulate removal, were selected for performance evaluation. The sludge, particulate, stack gas, scrubbing liquid, and ash were sampled and analyzed for heavy metals, pesticides, and oxides of nitrogen and sulfur. The results indicated that incinerators are capable of achieving low emission concentrations for the common pollutants. Particulate samples showed a measurable concentration of lead. The ash samples normally showed a higher concentration of the heavy metals when compared with the sludge samples. The pesticides and PCB results indicated complete destruction.

Identifiers: *Water pollution effects (Animals), Fishkill, *Water pollution detection, Bluegills.

In conjunction with already existing methods for measuring the chemical and physical characteristics of water, methods for rapidly measuring biological effects of water quality would be very useful. Thus the authors studied the effects of pollution on the breathing rates of bluegills. The presence of zinc at concentrations of 8.7 5.22, 4.16 and 2.55 mg/l in dechlorinated municipal tapwater was detected by an increase in breathing rate or a change in breathing rate variance of bluegills. None of the fish exposed to the three lower concentrations died during the experiments. The criterion for detection was an arbitrary number of responses occurring at the same time. An in-plant system for the prevention of fish kills caused by spills could be developed by monitoring several biological functions of fish simultaneously.

Identifiers: *Water pollution effects (Animals), Fishkill, *Water pollution detection, Bluegills.

A continuous monitoring system, consisting of an apparatus to detect light beam interruptions as a sign of aberrations in fish movement patterns, has been used to study the effects of fish exposure to lethal and sublethal concentrations of zinc. In addition to the exposure monitoring, the growth and reproductive success of exposed bluegill (Lepomis macrochirus) were studied. In the movement tests, Notemigonus crysoleucas and Carassius auratus were exposed to 2.94-3.64 mg/l zinc ions as zinc sulfate for 96 hrs. The ught system detected premortal movement aberrations allowing for survival of test fish by condition reversal. Analysis of LD50 levels was accomplished and recorded by atomic absorption spectrophotometry twice daily. Growth and reproduction tests involved exposure of one male and 3 females to Zn concentrations about equal to 0.1-0.01 of the lowest concentration detected by the monitoring tests. Eggs were collected and hatched separately. Concentrations of one-tenth the lowest zinc concentrations eliminated reproduction in the bluegills. (Author)

CORRELATION OF OILS AND OIL PRODUCTS BY GAS CHROMATOGRAPHY.
Technical rept.,
O. Zafiriou, M. Blumer, and J. Myers. Jul 72, 117p WHOI-72-55

Descriptors: (*Gas chromatography, Oils), (*Water pollution, Oils), Sources, Reviews, Alkanes, Aromatic compounds, Sulfur organic compounds, Nitrogen heterocyclic compounds, Geochemistry, Biodeterioration, Weathering, Sampling, Crude oil, Fuel oil, Laboratory equipment, Handbooks, New York, Maine.
Identifiers: *Oil pollution, Asphaltenes, Oil spills.

Environmental samples of oil and oil products can be correlated with possible sources by comparison of their stable compositional features. Procedures for correlating samples with suspected sources by gas chromatographic analysis under standardized conditions are presented in manual form. A high rate of success for the method in realistic situations is estimated by analyses of artificially aged oils and of potential spill sources found in Greater New York Harbor and Portland, Maine. The method is suitable for routine use for weeks-old oil samples, and for monitoring levels of hydrocarbons in organisms and sediments. Slightly modified, it can be used in low-level and research work studying the fate and effects of petroleum hydrocarbons. (Author)

Identifiers: Air pollution abatement, Low sulfur fuels, Sulfur containing fuels.

The research concerns sulfur control by means of coal gasification. Previous work has shown that desulfurization reactions on coal during pyrolysis and gasification are inefficient under equilibrium conditions. The experiments included measurements on the desulfurization kinetics (non-isothermal) for ten bituminous coals. An extensive series of measurements were conducted on the kinetics of H2S reactions with coal char and with the principal reactive constituents of char including carbon, iron, and calcium oxide. The kinetics of calcination for several dolomites and limestones were investigated. Experiments were also conducted on the pyrolysis of coal mixed with calcium oxide and on the gasification of coal with steam and oxygen both in the presence and absence of calcium oxide.

Descriptors: (*Clarification, *Flocculating), (*Sewage treatment, Clarification), (*Water treatment, Clarification), Flocculants, Quaternary ammonium salts, Polyelectrolytes, Pilot plants, Performance evaluation, Contacting, Filtration, Sewage filtration, Alums, Design criteria.

An experimental study of the interrelationships between filter operation, floc properties, and filter performance for water clarification was conducted. Two different clarification systems were investigated. One system had flocculation and sedimentation ahead of the filters. In the other, the pretreatment consisted of chemical addition and a brief period of rapid mixing. When operated in this latter manner, the filters were actually serving as contact flocculators. The technical and economic feasibility of water or waste water clarification by contact flocculation are demonstrated. It was concluded that a cationic polyelectrolyte, cat-floc

(dimethylpentamethylene ammonium chloride), is more effective than alum. A dual media filter, consisting of a very coarse, uniform coal layer on top of a shallow sand layer, performed better than others. The dependence of filter performance on such factors as chemical dose, filtration rate, and raw water suspended solids was also examined.

Identifiers: *Air pollution control, *Automobile exhaust, Air fuel ratio.

A report is presented of a program for which the objective was to reduce NO (x) mass emissions from a 4000-pound GVW vehicle by extending the operation of the engine in the ultra-lean air/fuel regime. The Phase I effort of the program consisted of a baseline vehicle evaluation with a carburetor, installation of Electronic Fuel Injection (EFI), and the baseline evaluation with EFI. The Phase II effort consisted of removing the engine from the vehicle and installing it on an engine dynamometer, performing steady-state tests at selected power test points, and, finally, exploring the possible ultra-lean operation using various parameters. The potential of reducing the NO (x) emissions with ultra-lean mixtures is seen clearly. However, ultra-lean mixtures are very prone to misfire resulting in increased HC emissions and rough engine operation giving poor drivability. On the other hand, the oxygen-rich exhaust, resulting from lean operation, appears to offer the possibility of a thermal reactor or a catalyst for oxidizing HC without secondary air.

One means of reducing SO2 air pollution from fuel combustion involves the injection of limestone directly into a furnace to effect vapor phase calcination and sulfation reactions. The report reviews this process and its basic objective to provide an independent assessment of the status of the Dry Limestone Process Technology and to update the design bases to reflect any additional process information. All available information was reviewed on the Fry Limestone Injection Process and pertinent correlations and equipment design recommendations were derived wherever possible. The emphasis was placed on the evaluation of data from in situ calcination-sulfation studies taken in flow reactors designed to simulate commercial boilers. The correlation approach was developed for a 'shrinking core' model, i.e., where SO2 gas must diffuse through a reaction product layer (CaSO4) to reach the shrinking inner core of available reactant (CaO). Attempts were made to test the reaction system model against data obtained in other flow reactor studies. Efforts were also made to compare the model with some initial test data. Available information was reviewed for the obvious important equipment performance parameters, e.g., effect of additives on slagging characteristics, efficiency of dust removal equipment, and sluice water quality control.

Identifiers: *Chemically Active Fluid Bed Process, *Air pollution control, Waste gas recovery.

The Chemically Active Fluid Bed (CAFB) process involves the desulfurization of a fuel oil using a hot fluidized bed of lime to oxidize and gasify the oil. The lime is then regenerated and reused. The present report discusses the following: Survey operating characteristics of two limestones and one residual fuel oil to determine their suitability; Select the best of the two stones for further testing; Construct two new batch reactor CAFB laboratory experimental units; Measure the effects of important operating variables on the CAFB process using batch reactor experiments with the selected oil-limestone combination; Operate for 200 hours of gasification a continuous CAFB gasification pilot plant.

Hamilton Waste Water Treatment Plant, Ohio.
FULL SCALE CONVERSION OF ANAEROBIC DIGESTERS TO HEATED AEROBIC DIGESTERS.

Aug 72, 62p EPA-R2-72-050
Contract WPRD-187-01-68

Descriptors: (*Digesters, *Aerobic processes), (*Sewage treatment, Aerobic processes), Heating, Paper industry, Industrial wastes, Odors, Conversion, Heat measurement, Digestion (Decomposition), Sludge digestion, Design criteria, Ohio.
Identifiers: Hamilton (Ohio).

Full plant scale experiments were made to determine the effect of heated aerobic digesters on digestion of waste water treatment plant sludge. Existing heated, floating cover equipped, anaerobic digesters, which had failed under excessive paper mill waste discharge, were converted to this purpose by addition of blower supplied air. Excessive odor production as temperatures increased prevented conclusion of the total program or any single phase. No practical method for control of temperature resultant from bacterial energy exerted in volatile reduction could be devised. The experiment was beneficial in determining the extent of practical application, and in establishing that thermophilic digestion temperature ranges could have produced significant volatile reduction. Determinations made also afford a measure of energy (heat) generated by aerobic bacteria in destruction of waste.

Descriptors: (*Sewage filtration, *Size screening), (*Sewage treatment, Size screening), (*Clarification, Sewage treatment), Reviews, Pilot plants, Performance evaluation, Field tests, Activated sludge process, Trickling filtration, Lagoons (Ponds), Particle size, Design criteria, Mathematical models, Computer programs.
Identifiers: *Microscreens, Tertiary sewage treatment.

Field, laboratory, theoretical, and state-of-the-art studies were conducted with regard to use of microscreens for tertiary sewage treatment appli-

cations. Field studies were conducted with two pilot microscreen units, using a variety of screen sizes and types, for activated sludge, trickling filter, and oxidation pond effluents. Particle size distribution of the effluents (microscreen influents) were found to be the key characterizing parameter in determination of treatment effectiveness. Overall effectiveness of solids removal was low, and was ascribed to deficiencies in microscreen design practice for the transfer of screened solids from the screen to the backwash system and out of the microscreen unit. A computer model of the process was developed in a format compatible with the EPA Executive Program for Optimization of Treatment Systems. (Author)

Identifiers: *Lake Tahoe, *Eutrophication, Sewage treatment effluent, Sanitary landfills.

A survey was made of nutrient and other chemical constituents of surface waters from developed and undeveloped land areas, sewage effluents, seepage from septic tank percolation system and refuse fills, drainage from swamps, precipitation, and Lake Tahoe water. Algal growth stimulating potential of the samples were bioassayed with Selenastrum gracile as a test organism. Algal response to nutrients was measured by maximum growth rate and maximum cell count in a 5-day growth period. Ponds simulating the shallow portions of the lake were used for continuous flow assay of the biomass of indigenous lake organisms produced by sewage effluent. Flask assays and chemical analyses were made over two years on three major creeks. Twenty-eight other creeks and precipitations were monitored by chemical analysis. Evaluating the eutrophication potential, Lake Tahoe is nitrogen sensitive and responds to it in proportion to its concentration.

Paper copy available from GPO $0.35 as EP2.10:16010EHR03/72.

Descriptors: (*Limnology, *Nitrogen cycle), (*Nutrients, Limnology), (*Aquatic microbiology, Nitrogen cycle), Nitrogen fixing bacteria, Nitrification, Ammonia, Inorganic nitrates, Inorganic nitrites, Oxidation, Reduction (Chemistry), Fungi, Fishes, Toxicology, Actinomycetaceae.
Identifiers: Denitrification, Eutrophication.

Biological nitrification as contributing nitrite and nitrate to lakes and streams was explored by determining: nitrifiers, growth sites and activity; denitrifying bacteria numbers and their potential activity as opposing nitrification; field data on nitrite-nitrogen and nitrate-nitrogen in terms of nitrifier and denitrifier populations. Biological nitrification, both heterotrophic and autotrophic, was demonstrated. Even though opposing processes, nitrification and denitrification can coexist in close succession or in adjoining microhabitats. Field values for nitrate-nitrogen and nitrite-nitrogen vary considerably and must be viewed as net values at any given time. Thirteen species of fishes varied greatly in resistance to nitrite-nitrogen. Nitrite toxicity may influence fish species dominance in a eutrophic lake.

Identifiers: *Eutrophication, *Sewage treatment effluent, Tertiary sewage treatment, Denitrification, Indian Creek Reservoir, Lake Tahoe.

The water impounded at Indian Creek Reservoir near Lake Tahoe, California is approximately one-third surface runoff and direct precipitation and two-thirds reclaimed water exported from South Tahoe Public Utility District Plant. Discussed are the results of tests which determined the temporal changes and relationships between water quality characteristics of Indian Creek Reservoir and those of the reclaimed water. Initially the reservoir would not support fish life, but as the reservoir matured, ammonia levels declined to less than 4 mg/l and by 1970 it was an excellent trout fishery. Approximately 70% of the ammonia nitrogen was lost to the atmosphere by nitrification-denitrification. Good biological productivity indicated access to other phosphorus sources, probably runoff. Relative to conductivity and chemical components the water is of good irrigation quality. Various parameters showed that the reservoir responds to more complex factors than those measurable in the reclaimed waste water, raising the question of the effectiveness of tertiary treatment for recreational impoundments.

Paper copy available from GPO $1.00 as EP2.10:12020 DJT 06/71.

Descriptors: (*Water pollution, *Industrial wastes), (*Industrial waste treatment, *Polyvinyl chloride), Latex, Chemical industry, Coagulation, Flocculating, Clarification, Iron inorganic compounds, Coagulants, Activated sludge process, Pilot plants, Biochemical oxygen demand, Aerobic processes, Process variables, Suspended sediments, Dissolved organic matter.
Identifiers: Biological industrial waste treatment.

The report discusses the investigations of various types of wastewater treatment systems to adequately treat wastes from a polyvinyl chloride plant. Both primary and secondary treatment methods were investigated. Waste equalization; solids removal by chemical coagulation, dissolved air flotation, and clarification; activated carbon adsorption; contact stabilization; completely mixed activated sludge; and various other methods were considered and studied. The report discusses the studies performed with a major emphasis placed on those processes found most applicable to the treatment of PVC wastes. A description of laboratory methods and pilot plant equipment is included. Typical data is presented and interpreted in terms of process design. In addition, full-scale plant operation is discussed in relation to individual unit operations and unit processes. Actual operating data is included. Lastly, wastewater recycle and reuse is included.

Laboratory studies were conducted to investigate the basic factors affecting nitrogen oxide formation in the combustion of fossil fuels. A jet-stirred combustor and a multiburner (so-named because of its ability to burn gas, oil or pulverized coal fuels) were used. The jet stirred combustor was used to study NO (x) formation in combustion under kinetically limited conditions. The combustion conditions were selected to be pertinent to stationary sources such as furnaces and boilers with peak temperatures ranging from 2500-3500 F. Preliminary experiments were performed with the multiburner which indicated the influence of heat losses and residence time on NO (x) emissions in the combustion of methane/air. The multiburner was used as a rudimentary flow reactor to study the formation of nitrogen oxides in air at high temperatures. The mathematical model has been extended to allow calculations of NO formation under fuel-rich conditions. Particle combustion capability has been incorporated into the model and mixing effects can be handled with the macromixing option. Test cases have been run for the above options which indicate the correct order of magnitude predictions and the correct directional effect of combustion modifications on NO (x) emissions.

Identifiers: *Air pollution abatement.

A description is presented of studies on coal desulfurization and related investigations. The work has emphasized the application of non-isothermal kinetic studies to the theoretical, experimental, and practical problems associated with the removal of sulfur from coal. To increase the efficiency and precision of data acquisition and interpretation, a computerized non-isothermal kinetic laboratory has been designed, built, and put into operation. Detailed non-isothermal kinetic studies of the desulfurization and gasification of five bituminous coals, lignite, anthracite, and pyrite, under reducing and oxidizing atmospheres have been conducted. An attempt has been made to identify the types of sulfur bonding associated with the removal of sulfur. Non-isothermal kinetic measurements7 of the removal of hydrogen sulfide produced in the desulfurization under both reducing and oxidizing condition by calcium oxide and dolomite have been carried out. Reactions of hydrogen sulfide with iron, iron sulfide, and various coal chars have also been investigated.

Identifiers: *Air pollution control, *Limestone injection, Waste gas recovery.

Fluidized bed processing of high-sulfur fossil fuels is evaluated for economical steam and/or power generation within projected pollution control limits. In fluidized bed combustion the sulfur dioxide and nitrogen oxides are minimized during the combustion process, and the heat transfer from the burning fuel to evaporating water is facilitated to achieve a more economical boiler system. In fluidized bed gasification a clean fuel gas with minimal sulfur and particulates is produced which can be utilized for power generation at atmospheric pressure in conventional gas-fired boilers or at elevated pressures in a gas-turbine combustor. The report is a condensation of the complete report; all the technical details of the work are contained in Volume II and III which will be released at a later date. No problems have been identified which would preclude the development of fluidized bed combustion boilers. The atmospheric pressure fluidized bed oil gasification concept has been technically demonstrated with a 750 kW development gasification plant.

DETECTION OF ABANDONED UNDERGROUND COAL MINES BY GEOPHYSICAL METHODS.

Apr 71, 105p W72-13045, EPA-14010-EHN-04/71
Paper copy available from GPO $1.00 as EP2.10:14010 EHN 04/71.

Descriptors: (*Geophysical prospecting, Coal mines), (*Mine waters, *Water pollution), (*Coal mines, Abandonment), Mine surveys, Geophysical surveys, Seismic reflection method, Seismic refraction method, Resistivity exploration, Impedance exploration, Feasibility.
Identifiers: *Abandoned coal mines.

Acid drainage produced by abandoned coal mines continues to cause serious water pollution problems. Without knowing the exact location of

the concealed openings and the extent of the mine, source abatement techniques are virtually impossible. Drilling is the only known method for accurately determining the location and extent of the mine voids, but this is extremely expensive. This project attacks the problem through field studies of the following geophysical methods: electrical resistivity, self-potential, infrared radiometry, total field and differential magnetometry, seismic refraction and reflection, very low frequency electromagnetic and induced polarization over well-documented, drift, coal mines. Airborne infrared radiometry proved to be an excellent tool for detecting and mapping acid mine/fresh water sources, acid mine/fresh water drainage, and fracture traces under selected conditions. The objective was to develop and evaluate, at full plant scale, the combined chemical-biological process of phosphorus removal. Alum proved to be a more effective precipitant than sodium aluminate in the moderately alkaline wastewater used. Total phosphorus concentration of the unfiltered effluent was dependent upon effluent suspended solids levels as well as on effluent soluble phosphorus concentrations. Removal of organic matter was improved as a result of chemical addition in the chemical-biological process. The chemical-biological process produced approximately twice as much weight of sludge as did the parallel control. Alum addition did not reduce the sludge volume index (SVI) of the mixed liquor whereas sodium aluminate addition resulted in significant decreases. Costs for chemical precipitation of phosphorus in the chemical-biological process are estimated. (Author)

Sludges containing aluminum phosphorus precipitates from an activated sludge waste water treatment plant were digested in a high-rate digester. Sodium aluminate and liquid alum were used to precipitate the phosphorus from the waste water. Analyses on both raw and digested sludges showed that once precipitated from the waste water and incorporated into a sludge the phosphorus did not redissolve while undergoing anaerobic digestion. Most of the soluble phosphorus in both the raw and digested sludges was in the orthophosphate form, and the addition of the inorganic aluminum phosphorus complexes did not adversely affect the anaerobic digester. High concentrations of soluble aluminum ion did not appear in the anaerobic digester, and the use of alum for phosphorus removal caused no additional hydrogen sulfide production during sludge digestion. Analyses also indicated the addition of aluminum compounds enhanced the dewatering properties of the raw sludges. (Author)

Identifiers: *Water pollution abatement, *Propham, *DCPA herbicide, *Bromacil, Monuron, Atrazine, Dicamba, Amiben, Diuron.

The introduction of microorganisms with specific degradative capacities into the soil was shown to be a possible means of ridding the soil of contaminating chemicals. An investigation of the interactions of soil microorganisms and several groups of herbicidal compounds, primarily chlorinated derivatives, was made. In pure ulture and in soils the addition of 2,3,5,6-tetrachloroterephthalate (DCPA) had little effect upon bacterial growth, and several microorganisms appeared to use the herbicide as a carbon source. The encouragement of the soil microflora by the addition of nutrient broths resulted in a reduction of toxicity to plants of a number of herbicides. Isopropyl N-phenylcarbamate (IPC) degrading organisms, when added to soil, accelerated the degradation of IPC and related compounds. A membrane 'biologicalilter' device for reducing waterborne biodegradable pollutants was also demonstrated using these organisms.

The design, construction, and testing of, an oil skimming and separation system capable of processing 30,000 gallons per hour, and operating on the open ocean under Sea State 3 conditions is described. A 45 x 26-foot twin-hulled barge, which contained an entrance paddle wheel and self-adjusting skimming weirs, was built to support the skimming and separation equipment. A 500-gpm centrifuge was used to reduce the oil content of the discharge water to less than 100 ppm. The recovered oil contained less than 5 percent water. The oil content of the discharge water could be reduced to less than 20 ppm by recycling it through the centrifuge a second time. Intentionally spilled oils of API 15, 26, and 35 gravities were recovered and separated, as were weathered oil slicks. The centrifuge was particularly useful in separating the mixtures of water and the higher API gravity oils.

OPTIMIZATION OF AMMONIA REMOVAL BY ION EXCHANGE USING CLINOPTILOLITE.
Water pollution control research series.

Sep 71, 192p W72-13254, EPA-17080-DAR-09/71
Paper copy available from GPO $1.50 as EP2.10:17080 DAR 09/71.

Descriptors: (*Chemical removal (Sewage treatment), *Ammonia), (*Ion exchanging, Ammonia), (*Sewage treatment, Ion exchanging), PH, Nitrogen, Cost estimates, Performance evaluation, Pilot plants, Regeneration (Engineering), Operating costs, Design, Capital costs.
Identifiers: Zeolites, Tertiary sewage treatment.

The zeolite ion exchanger clinoptilolite was investigated with the objective of optimizing its application to ammonia removal from wastewaters. The study included multiple cycle pilot plant operations at three municipal sewage treatment plants. Particular attention was given to cation interference with exhaustion performance and with minimum cost regeneration. The ammonia capacity of clinoptilolite was found to be nearly constant over the pH range of 4 to 8. In regeneration the pH was critical in determining the NaCl requirements, a higher pH favoring lesser amounts of salt. An average ammonia removal of 95.7% was obtained. The cost of ammonia removal was estimated. Ammonia removals down to less than 0.5 mg/l NH3-N is technically feasible, but only with shorter exhaustion runs and greater regenerant requirements. A PREDICTIVE MODEL FOR THERMAL STRATIFICATION AND WATER QUALITY IN RESERVOIRS.
Mark Markofsky, and Donald R. F. Harleman. Jan 71, 286p W72-13309, EPA-16130-DJH-01/71
Paper copy available from GPO $2.00 as EP2.10:16130 DJH 01/71.

Descriptors: (*Reservoirs, Water quality), (*Water quality, Mathematical models), (*Temperature gradients, Reservoirs), Stratification, Water pollution, Stream pollution, Mixing, Lakes, Water flow, Diffusion, Computer programs, Heat, Dissolved gases, Oxygen, Biochemical oxygen demand, Forecasting.

Modifications are made on a one-dimensional analytical thermal stratification prediction method to include the time required for inflowing water to reach a dam face. A one-dimensional water quality model is developed which incorporates the internal flow pattern predicted for a stratified reservoir from the temperature model. The water quality model is designed to predict the concentration of particular water quality parameters in the outflow water as a function of time. It is tested by comparisons with measurements of outlet concentrations resulting from pulse injections of a conservative tracer into a laboratory reservoir. The application of the mathematical model to a field case of practical interest is demonstrated by solving the coupled set of water quality equations for B.O.D. and D.O. predictions in Fontana Reservoir. It is concluded that the model is capable of predicting the effect of reservoir impoundments on water quality.

Identifiers: *Limestone scrubbing, Alkaline scrubbing, *Air pollution control.

Previously a theoretical interpretation of the complex chemistry and chemical engineering aspects of the limestone injection - wet scrubbing processes was developed. The work described illustrates two means of using such a theoretical model to gain valuable process insight. A series of process simulations is described. These results demonstrate how the chemistry and performance of the limestone injection - wet scrubbing process vary with important parameters. The results of a pilot scale test series are presented. Analytical methods and data analysis techniques were developed and demonstrated. In addition, a computational technique was developed for making enthalpy balances in limestone scrubbing liquors.

Contract CPA-70-45
See also Volume 1, PB-211 748 and Volume 3, PB-211 750.

Descriptors: (*Limestone, *Adsorbents), (*Adsorption, *Sulfur dioxide), (*Air pollution, Sulfur dioxide), Scrubbers, Mathematical models, Process control, Performance evaluation, Enthalpy, Thermodynamics, Applications of mathematics, Computerized simulation, Chemical engineering, Chemical equilibrium, Reaction kinetics.
Identifiers: *Limestone scrubbing, Alkaline scrubbing, *Air pollution control.

The volume contains three technical notes relating to the limestone injection wet scrubbing process (LIWS). The first concerns the calculation of the enthalpy of aqueous ionic solutions. It outlines the method for calculating enthalpy: The thermodynamic basis, the derivation of the equations for the difference between ideality and reference state, and the means of selecting the reference states. A comparison is made between experimental and calculated values. Next a description is presented of the Radian process model for the prototype LIWS system. This technical note presents a description of the Radian process model. A brief description of the LIWS process with regard to its relationship to the process model is followed by listing of the model assumptions and parameters. Included is a detailed description of the model. Finally equilibrium calculations for Type I APCO inhouse experiments are given. This technical note gives the results of equilibrium calculations made during analysis of data from SO2 scrubbing experiments.

Identifiers: *Limestone scrubbing, Alkaline scrubbing, *Air pollution control.

The third volume of a three volume study of the limestone injection wet scrubbing process, is presented. The computerized simulation system is conducted by a combination of three computer programs: (1) the executive section, which provides control and information on the progress of a simulation run; (2) the equipment routines which perform the calculations necessary to model the unit process operations; (3) the auxiliary section which is a collection of routines that provide special calculations for equipment routines, interface other programs and summarize the results of a run. This volume contains a description of this system, operating instructions, a technical note describing the equilibrium program used by the system, a sample data input, and program listings.

CYCLIC OPERATION OF PLATE COLUMNS FOR GAS-LIQUID CONTACTING.
Rept. for Oct 71-May 72,
James D. Dearth, Lawrence B. Evans, and Edwin R. Gilliland. 1 May 72, 76p* EPA-R2-72-023
Contract EPA-68-02-0018

Descriptors: (*Contactors, Cyclic loads), (*Absorbers (Equipment), Cyclic loads), (*Scrubbers, Cyclic loads), (*Air pollution control equipment, Contactors), Design, Chemical engineering, Axial flow, Air flow, Liquid flow, Stead state, Head (Fluid mechanics), Hydraulics, Mixing, Mathematical models.

Previous experimental and theoretical work has indicated that the efficiency and capacity of gas-liquid contacting equipment may be improved by controlled-cycling of gas and liquid flows. The report describes a proposed program for obtaining needed information on tray hydraulics and liquid mixing, and summarizes some initial data and tentative conclusions for both steady-state and cyclic flows of an air-water system in a three-tray section of a cyclic absorber. Fluctuations in liquid-heads and interstage pressure differences; entrainment of small air bubbles in the downflowing liquid; and weepage of liquid due to liquid 'sloshing' in the gas flow period have been found to have a pronounced effect upon column hydraulics. SO2 FREE TWO-STAGE COAL COMBUSTION PROCESS.
Aug 72, 55p* EPA-R2-72-035
Contract CPA-70-146

Descriptors: (*Coal, Desulfurization), (*Liquid metals, Desulfurization), (*Air pollution, *Sulfur dioxide), (*Coal gasification, *Desulfurization), Combustion products, Iron, Slags, Oxidation, Carbon monoxide, Sulfur, Electric power plants, Boilers, Coal preparation, Manufactured gas, Cost estimates, Design, Iron sulfides, Performance evaluation, Combustion chambers, Carburizing, Regeneration (Engineering), Capital costs.
Identifiers: *Air pollution control, Waste gas recovery.

A new process has been developed for removing sulfur from coal (as power plant fuel) during the combustion phase. In this process, coal is dissolved by injection into molten iron and simultaneously the dissolved coal carbon is oxidized with injected air to carbon monoxide. Under the reducing conditions existing during combustion, coal sulfur is not oxidized, but transferred from the iron to a slag consisting of coal ash and added limestone. Thus, a sulfur-free offgas is produced for use in power plant boilers. Experimental combustor studies have shown that a boiler stack gas, containing less than 50 ppm sulfur dioxide is produced. Combustor design parameters were established, and indicate that three 38-foot I.D. combustors are required for a 1000 MW plant. Laboratory work has shown the slags can be successfully desulfurized with steam to produce elemental sulfur and a H2S/SO2 gas stream suitable for additional elemental sulfur recovery in a Claus Plant. Costs are given. (Author)

AN INITIAL TEST OF THE APPLICABILITY OF INVARIANT MODELING METHODS TO

ATMOSPHERIC BOUNDARY LAYER DIFFUSION,
Coleman duP. Donaldson, and Glenn R. Hilst. Oct 71, 64p ARAP-169 APTD-1149
Contract EPA-68-02-0014

Descriptors: (*Air pollution, *Atmospheric diffusion), Mathematical models, Mixing, Wind (Meteorology), Temperature, Turbulent diffusion, Shear stress.
Identifiers: Atmospheric boundary layer.

The study concerned the movement of air pollution in the atmosphere. With only prior knowledge of the mean wind and temperature profiles and using a relationship between the macroscale and the dissipation scale derived for laboratory scale flow, the structure of turbulence and the diffusion of matter were simulated well within an order of magnitude of observed values. In most cases, the verification is within a factor of two. Perhaps most importantly all of the classical requirements for asymptotic behavior of the diffusion were met. The predictions were somewhat more exact for neutral and unstable temperature stratification than for stably stratified atmospheres. A greater understanding of the physics of turbulent transport has been achieved and has led directly to further improvement and refinement of the model. The dependence of the scale on stability has been clarified.

Identifiers: Biological industrial waste treatment, Brewing industry, Military facilities, Poultry processing, Tanneries, *Water pollution control.

A two volume compilation, review and critique of the literature on biological trickling filter studies and related pollution abatement processes have been made. In the report, the literature review and critical analysis, is divided into: Introduction, definitions, history and background theory of the trickling filter process; Plant design, materials of construction, operation, maintenance and performance; Trickling filter research and development approaches, ecology, and patents, and Applications of trickling filter to specific industrial wastes. Based on the review, several general conclusions were drawn. There is no well-defined theory of design and operation. Much published work was redundant, and European efforts were not readily accepted in the United States, and vice versa. The literature reflects cycles of interest in trickling filters. The process is not applicable to all pollution problems, but its shock survival capabilities and rapid flow-through time are definite advantages which cannot be overlooked in any design of a waste treatment facility.

Descriptors: (*United States, *Pollution), (*Air pollution, United States), (*Water pollution, United States), Reviews, Evaluation, Water quality, Land use, Wildlife, Indicator species, Forecasting, Trends, Environmental surveys, Demography, Economic analysis, Natural resources, Socioeconomic status, International relations, Oceans, Government policies, Radioactive contaminants, Public health, Abatement, Materials recovery, Decision making, Cost estimates, Industrial wastes, Waste disposal, Noise reduction.
Identifiers: *Solid waste disposal, *Noise pollution, Air quality, Endangered species, Air pollution abatement, Water pollution abatement, National Environmental Policy Act, National Parks, Economic impact.

The report emphasizes both status of and trends in environmental quality. It discusses the interrelationships of population, technology, pollution, and other factors that will shape our future environment. Discussed are this year's major developments at the international level and specific substantive issues such as the international trade effects of environmental controls. Coverage of developments at Federal and State levels has been extended to the local level, with a case study of local efforts to control noise. Included is an update of last year's cost figures and a description of impacts of pollution control costs on 14 industries as well as on the overall economy. The report contains a comprehensive analysis of NEPA (National Environmental Policy Act) and a discussion of the National Parks. (Author)

Descriptors: (*River basin development, *Decision making), (*Regional planning, River basin development), Computerized simulation, Interactions, Gaming models, Water resources, Water quality, Allocations, Local government, Economic analysis, Demography, Socioeconomic status, Management.
Identifiers: River Basin Model, *Water pollution abatement.

The RIVER BASIN MODEL is a man-machine simulation model used to delineate the interactions taking place, within a real or hypothetical area, between the local water system and the economic, social and governmental activities of that area; it is a model of an entire regional system, with water a subsystem realistically interacting with all the other major subsystems, such as housing and transportation. A gaming format is employed. The Governmental (provides public services) Sector and the model required by its Chairman team, and the computer printed output are described. Each political jurisdiction has a chief executive called the Chairman. The report describes the functions of the Chairman in this simulation. The Chairman makes departmental appointments to the local government departments, and he sets budget policy decisions. His office is an elected one, and periodic elections are held in which the members of the Social Sector vote for nominated candidates.

See also report dated Aug 70, PB-195 830.
Paper copy available from GPO $1.00 as EP2.10:16110EGQ04/72.

Descriptors: (*Water quality, *Mathematical programming), (*Regional planning, Water quality), (*Water pollution, Mathematical programming), Management planning, Stream pollution, Dissolved gases, Oxygen, Sewage treatment, Aeration, Reservoirs, Stream flow, Mathematical models, Matrices (Mathematics), Bypasses, Financing, Taxes, Expenses, Cost estimates, Nonlinear programming.
Identifiers: *Water pollution abatement, Water pollution taxes (Charges), Sewer surcharges.

The objective of the research was to develop a general practical planning tool to provide optimal solutions for the complex choices involved in balancing alternative methods for attaining water quality goals. Extended is the earlier work, 'Mathematical Programming for Regional Water Quality Management'. A mixed integer, continuous variable non-linear programming model is developed which promises to be much more realistic and effective in selecting an optimal configuration of regional treatment plants and pipe juncture nodes. A new Bender's type decomposition for the non-linear model is also presented as an appropriate and feasible solution technique. The dissolved oxygen profile and the control options were linked. The work shows how the transfer coefficients can be recalculated periodically in the course of the system optimization. The theoretical framework for including two additional treatment methods, mechanical re-aeration and flow augmentation via reservoirs is also developed.

GUIDE FOR COMPILING A COMPREHENSIVE EMISSION INVENTORY.
Jun 72, 202p* APTD-1135

Descriptors: (*Air pollution, Data retrieval), Data handling, Inventories, Data processing, Sources, Instruction manuals, Geography, Populations, Computer systems programs, Coding, Waste disposal, Data acquisition, Industrial wastes, Combustion products, Hazardous materials, State government, Local government, Fuels, Evaporation, Exhaust gases.
Identifiers: Emission factors, Solid waste disposal.

The manual describes, in detail, procedures for obtaining and codifying information about air pollutant emissions from stationary and mobile sources. Automatic data processing, charts, and maps are discussed as presentation techniques, and a step-by-step description of data acquisition is provided. The system has been developed specifically for use by state and local air pollution control agencies. A uniform coding system for the data is encouraged. Detailed procedures are given concerning the information to be gathered from each source, the methods to be used to gather the information, the codes to be used to simplify the information on standard coding forms, the geographical and population information needed about the area of interest, the apportionment techniques and emission factors needed, and the methods of displaying the data. GROUND WATER INFILTRATION AND INTERNAL SEALING OF SANITARY SEWERS, MONTGOMERY COUNTY, OHIO.

Jun 72, 76p W72-14441, EPA-11020-DHQ-06/72
Paper copy available from GPO $0.75 as EP2.10:11020 DHQ 06/72.

Descriptors: (*Sanitary sewers, Fluid infiltration), Seepage, Sealing, Joint sealers, Joints (Junctions), Television equipment, Inspection, Flow rate, Maintenance, Water pollution, Abatement.
Identifiers: Storm water runoff, Illegal sewer connections, Water pollution abatement.

A program for pollution abatement was undertaken to study the effects of infiltration reduction in sanitary sewers by joint sealing and to study closed circuit television techniques. Water pollution from municipal wastewater treatment plants would be reduced if peak flows from rainfall could be reduced. The study evaluates the effects of remedial repairs to joints by use of pressure grouting of small main line sewers. A minimal measurable amount of quantity flow reduction was attributed to the sewer sealing program. Infiltration from extraneous storm water, illegal connections, and basement underdrains seem to outweigh the contribution due to leaky joints to such a degree that reduction due to joint sealing was obscured. The study does show the significance of internal television system as an inspection and maintenance tool. This information on costs, operation, and procedure is of value to anyone interested in this field. (Author)

NITROGEN REMOVAL FROM WASTEWATERS.

Oct 70, 32p* W72-14650, EPA-WQO-17010-10/70
Supersedes report dated May 70, PB-206 306.

Descriptors: (*Chemical removal (Sewage treatment), *Nitrogen), (*Sewage treatment, Chemical removal (Sewage treatment)), (*Water pollution, *Nitrogen inorganic compounds), Reviews, Inorganic nitrates, Ammonia, Nutrients, Activated sludge process, Stripping (Distillation), Cost estimates, Ion exchanging, Biodeterioration, Nitrification, Chlorination.
Identifiers: Denitrification, *Water pollution control.

Classically, sewage treatment has been directed toward the removal of suspended solids, biochemical oxygen demand and reduction of bacterial contaminants. Removal of nutrients such as phosphorus and nitrogen has been incidental to treatment processes. The rapid increase in severe eutrophication problems in recent years has focused attention on nutrient control from municipal sources. The report provides a state of the knowledge on nitrogen removal. The contents include: Nitrogen removal from wastewaters--statement of the problem; Nitrogen removal by biological suspended growth reactors; Nitrogen removal by column reactors; Ammonia nitrogen removal by stripping with air; Removal of ammonia nitrogen by selective ion exchange; Ion exchange for nitrate removal; Other methods for removing nitrogen; Salt Creek two state nitrification plant.

STATE OF THE ART OF TEXTILE WASTE TREATMENT.
Water pollution control research series rept.

Feb 71, 356p W72-14827, EPA-WQO-12090-ECS-02/71
Paper copy available from GPO $2.50 as EP2.10:12090-ECS-02/71.

Descriptors: (*Textile industry, *Industrial waste treatment), (*Water pollution, *Industrial wastes), Reviews, Bibliographies, Inventories, Synthetic fibers, Natural fibers, Lagoons (Ponds), Activated sludge process, Trickling filtration, Detergents, Dyes, Sludge disposal, Industrial engineering, Cost estimates, Legislation, State government, Government policies, Textile finishing, Sizing materials, Cotton fabrics, Woolen textiles, Rayon, Acetate fibers, Polyester fibers, Acrylic fibers, Public law.
Identifiers: *Water pollution control, Biological industrial waste treatment, Tertiary sewage treatment, Water pollution abatement.

A study has been made of waste treatment methods and practices used in the textile industry. Information was obtained from people working in the textile processing industry, designing waste treatment plants, and enforcing state and federal regulations on waters discharged to streams and natural reservoirs. To supplement this information the literature was reviewed and an annotated bibliography prepared. The report contains sections on the following: characteristics of textile waste, waste treatment techniques, treatment methods in use, effects of textile wastes on receiving waters, the cost of waste treatment operations, and state and federal regulations governing discharge waters. Areas of needed research are recommended. The annotated bibliography contains references on synthetic fiber manufacturing wastes, detergent waste treatment, instrumentation, plant design, water treatment for plant use as well as articles pertaining specifically to textile waste treatment.

Identifiers: *Petrochemical industry, *Water pollution control, Chemical oxygen demand, Biological industrial waste treatment, Reverse osmosis, Tubular membranes, Solid waste disposal.

The purpose of the report is to compile and organize the many components which constitute a preliminary waste water treatability study for the refinery and petrochemical industry. Case studies indicate that locating, analyzing, and properly interpreting the nature of pollutional sources within a petrochemical of refinery complex is the basis from which a treatability study can be developed. Each of the wastewaters including normal process and utility effluent, contaminated storm runoff, ballast water discharge, and other related sources of wastewater, must be properly characterized with respect to their organic and inorganic constituents. The treatability study must be programmed to yield definitive information concerning pollutional removal rates, anticipated levels of residual or non-removable constituents, and treatment process requirements.

MONITORING MERCURY VAPOR NEAR POLLUTION SITES.
Water pollution control research series.

May 71, 65p W72-14714, EPA-16020-GLY-05/71
Paper copy available from GPO $0.70 as EP2.10:16020 GLY 05/71.

Descriptors: (*Mercury, *Spectrochemical analysis), (*Air pollution, Mercury), (*Water pollution, Mercury), Sources, Monitors, Water analysis, Gas analysis, Spectrometers, Atomic spectroscopy, Industrial wastes, Field tests, Mercury ore deposites, Geysers.
Identifiers: *Atomic absorption spectroscopy, *Water pollution detection, *Air pollution detection.

Field and laborstory measurements were made to demonstrate that mercury vapor in the air near mercury-polluted water or sediment can be detected using an extremely sensitive detector, the Barringer Airborne Mercury Spectrometer. Areas were visited where the presence of mercury was known from fish, water, or sediment analyses; anomalous mercury levels ranging from 50 to more than 20,000 nanograms per cubic meter were detected. Anomalous concentrations of atomic mercury vapor in air may be classified as natural or man-made. Laboratory studies demonstrated that the mercury spectrometer is sensitive only to atomic mercury. By means of pyrolysis or combustion, organic compounds could be detected. To detect mercury pollution in water, pyrolysis appears necessary to convert combined mercury to the atomic state for measurement by rapid spectrophotometric techniques.

Contract FWPCA-14-12-566

Descriptors: (*Chemical removal (Sewage treatment), *Phosphorus), (*Sewage treatment, Chemical removal (Sewage treatment)), (*Aluminum oxides, *Adsorbents), Inorganic phosphates, Pilot plants, Performance evaluation, Columns (Process engineering), Desorption, pH control, Precipitation (Chemistry), Operating costs, Cost estimates, Water reclamation, Regeneration (Engineering), Calcium hydroxides.
Identifiers: Tertiary sewage treatment.

Alumina, a phosphorus-selective adsorbent, was used in a tertiary chemical process for phosphorus removal. A mobile pilot plant designed and built on the basis of laboratory results was fitted into a standard forty-foot van trailer. The secondary effluent was passed through a thirty inch multimedia filter bed and stored. Then the filtered sewage was pumped through one or more of three alumina beds approximately forty inches in depth and three feet in diameter. Phosphorus loading of the alumina columns can be in a downflow or upflow direction with the columns in series or parallel. NaOH was recirculated to remove absorbed phosphorus in an alumina column taken off the line. Valving and column washing was pH controlled. Ca (OH)2 as added to the NaOH solution in a mixing tank to precipitate phosphorus in the form of hydroxyapatite. The solids were removed in a continuous centrifuge and the Na (OH) returned for reuse. Initial operating costs are reported. (Author)

Descriptors: (*Detergents, *Corrosion), (*Plumbing, Corrosion), Amines, Sodium phosphates, Stainless steels, Nickel alloys, Brasses, Copper, Aluminum alloys, Zinc, Carbon steels, Lead, Cast iron, Corrosion tests.
Identifiers: *Acetic acid/nitrilo-tri, Steel 304, Steel 420, Aluminum alloy 1100, Nickel alloy 201, Steel 1020, Triphosphoric acid/ (pentasodium-salt).

Laboratory studies were conducted to determine the corrosion potential of nitrilotriacetic acid (NTA) as a substitute for sodium tripolyphosphate (STPP) in detergents. Coupon-weight loss and linear polarization studies were employed to investigate the corrosion of typical materials of construction which might be subject to exposure to NTA in normal use in laundering. Detergent formulations used were representative of heavy-duty granular detergents. Corrosion was generally greatest in NTA and STPP solutions with soft water. Tested were types 304 and 420 stainless steel, 201 nickel, 260 brass, electrolytic copper, 1100 aluminum, die-cast zinc, 1020 carbon steel, chemical lead, and cast iron. NTA detergents could increase metal ion pickup at a sewage plant by a factor between 1 and 7.

Water pollution control research series.

Mar 71, 77p W72-14919, EPA-12060-EHU-03/71
Grant WPRD-134-01-68
Paper copy available from GPO $0.75 as stock no. 5501-0092.

Descriptors: (*Food processing, *Industrial waste treatment), (*Brines, Industrial waste treatment), (*Water reclamation, Industrial waste treatment), Activated carbon, Canning, Regeneration (Engineering), Cost estimates, Capital costs, Waste disposal, Performance engineering.
Identifiers: *Olive processing, Water pollution control.

Activated carbon was used to treat storage brines and processing waters obtained from the production of canned ripe olives and glass packed green olives. Reconditioned brines were evaluated for reuse potential. Freshly harvested olives can be stored for commercially significant periods in reconditioned storage brines. Olives stored in reconditioned brine were of good quality. There was no detectable effect on final product quality with the reuse of reconditioned brines of lower salt content. When capital costs are amortized over 10 years for a cannery storing 5,000 tons of olives annually, estimates for commercial application of activated carbon treatment of storage brines show a cost per ton of olives stored of $3.64. Ten olive canneries sending spent carbon to a centrally located reactivation facility would have a cost of $1.28 per ton of olives stored. (Author)

RURAL STORAGE AND COLLECTION CONTAINER SYSTEMS.
Interim rept. 1 Jun 70-31 Oct 71.

1972, 155P EPA-SW-41D.I-72
Grant G06-EC-00271
Prepared in cooperation with Garretson-Elmendorf-Zinov-Reibin, Consultants.

Descriptors: (*Refuse disposal, *Containers), Storage, Project planning, Rural areas, Collecting methods, Earth fills, Cost analysis, California.
Identifiers: *Solids waste disposal, Humbolt County (California).

The objective of the project was to demonstrate and evaluate two alternative refuse storage and collection container systems for small isolated rural areas, with special emphasis on costs, workability, and community acceptance. The test area for the project is to be the southern one-third of Humboldt County, California, with a population of approximately 10,000 people. In the first system, waste will be deposited in a 40-cu-yd, roll-off container that can be picked up and hauled to the central sanitary landfill. In the second system, waste will be deposited in 8-cu-yd containers. These containers will be emptied at the site into a 42-cu-yd collection vehicle that will then proceed to the next container site or, if full, to the landfill. The interim report details the selection of collection equipment (both containers and vehicles) components, and the development of test procedures for evaluating the storage and collection systems.

Contract EPA-14-12-195
Paper copy available from GPO $0.60 as stock no. 5501-0071.

Descriptors: (*Sewage filtration, *Ultrasonic radiation), (*Sewage treatment, Sewage filtration), Combined sewers, Overflows, Cleaning, Maintenance, Plugging, Biochemical oxygen demand, Polyethylene resins, Performance evaluation.

Simulated combined sewer overflows and primary treatment plant effluent were used to test a 250,000 gpd compact ultrasonically cleaned microfiltration system composed of twenty porous polyethylene elements of 0.8 sq. ft. area each. Study indicates that the use of more costly porous stainless steel elements would alleviate the clogging of filters. Filter clogging at the Atlanta, Georgia test site prevented showing the feasibility of treating combined sewer overflows. In more suitable water pollution control applications, it is possible to reduce BOD and suspended solids in raw settled sewage, or effluents from primary and secondary plants by 50%, using ultrasonic filtration and having initial levels of influent BOD and suspended solids of 100 mg/l or less. A vortex separator was designed as a pretreatment device for the filter.

Paper copy available from GPO $1.25 as stock no. 5501-0088.

Descriptors: (*Sewage treatment, Oils), (*Activated sludge process, *Oils), Biodeterioration, Lubricating oils, Crude oils, Vegetable oils, Emulsification, Performance evaluation, Coagulation, Adsorption, Flotation, Filtration.
Identifiers: Oil wastes.

The performance of small scale continuous activated sludge systems was observed after being exposed to a variety of oily compounds such as crankcase oil, crude oil and vegetable oil, at several loading levels. Batch studies were conducted to determine biodegradability and the effect of emulsification and temperature on the rate of biological reaction. Oils are absorbed on the floc and slowly degrade when they are introduced into an activated sludge system. The oil accumulates on the sludge causing a loss of density and acceptable settling characteristics if the loading rate is higher than the degradation wastage. The ability of the microbial system to remove other substrates is not inhibited although the biological system fails due to the loss of sludge. (Author)

Descriptors: (*Air pollution, *Sulfur dioxide), (*Ozone, Air pollution), Correlation, Tables (Data), Urban areas, Linear regression, Diurnal variations, Missouri, California, Concentration (Composition).
Identifiers: Air quality data, Saint Louis (Missouri), Los Angeles (California).

The report describes the results of a data analysis study to determine the correlation between ozone (O3) and sulfur dioxide (SO2) concentrations in ambient air using data that had been obtained in Los Angeles and St. Louis. Sulfur dioxide concentrations were determined by the flame photometer detector method. Ozone concentrations were determined by the chemiluminescent reaction between ozone and ethylene. Not having an established gas phase reaction model as a basis for relating SO2 and O3 in this study, a series of simple linear regressions were performed to test or determine the significance of a relationship if it exists. Data sets consisted of hourly averages obtained at the same time each day. (Author)

Identifiers: *Air pollution detection, Mie scattering.

The validity of determining smoke plume opacity or particulate content from measurements of the backscatter of laser radiation from plume particulates was investigated. The backscatter experiments were conducted with the use of a specially designed aerosol chamber that allowed the experimental geometry to simulate that associated with actual remote plume probing. Raw fly ash collected from a bituminous coal burning power plant was classified into various size fractions and pneumatically injected into the chamber at controlled concentrations. The aerosol was continuously monitored by a white light transmissometer along the axis of the chamber. Lidar measurements were made to determine the backscatter and transmission of the generated aerosols. These results for fly ash indicate that plume opacity may be determined from lidar backscatter measurements at 0.7 microns wavelength, but that mass concentration is better inferred from 1.06 microns lidar backscatter measurements. A study was initiated as a result of the need to develop background and preliminary data on the environmental effects of coal-fired power plants. The objective of the study was to measure the concentration of eleven trace elements in plants and soils in the Four Corners area of New Mexico. Selection of the elements was made on the basis of data obtained from a survey on the chemical make-up of the fly ash emitted by the power plants in this location. These eleven elements are: As, Be, Cd, Cr, F, Pb, Mn, Hg, Mo, Ni, Se. Some of the elements studied, such as mercury, lead and selenium, are known to be toxic to animals in relatively low concentrations. This study, by sampling plants and soils in two different locations, attempted to develop preliminary data on the potential buildup of each trace element. (Author)

EVALUATION OF A MULTI-FUNCTIONAL MACHINE FOR USE IN SANITARY LANDFILL OPERATIONS IN SPARSELY POPULATED AREAS.
Final rept.,
V. L. Hammond. 1972, 218p* EPA-SW-39d-72
Grant G06-EC-00210

Descriptors: (*Earth handling equipment, Evaluation), (*Waste disposal, *Earth fills), Front end loaders, Bulldozers, Soil compacting, Chassis, Overhauling, Benefit cost analysis, Idaho, Oregon.
Identifiers: *Solid waste disposal, Sanitary landfills.

The report gives details of an investigation made of a multi-functional machine, known as the Multi-Mover, which was originally designed to perform the functions of a crawler tractor/dozer, dump truck, compactor, and loader. Its performance in accomplishing sanitary landfill and earthmoving operations was evaluated at several sites in Idaho and Oregon to determine its effectiveness both absolutely and in comparison with crawler tractors in compacting waste and soil cover material, excavating and spreading soil cover, and distributing refuse for compaction. Since the machine is a rubber-tired vehicle that can move over highways under its own power, its use at scattered sites in a sparsely populated area was also evaluated. The advantages and disadvantages that result from the basic concept of a multi-functional machine are presented, the economics of purchase and operation are analyzed, and certain modifications are recommended. THE USE OF BAGS FOR SOLID WASTE STORAGE AND COLLECTION.
Final rept.

1972, 297P* EPA-SW-42d-72
Grant G06-EC-00172
Prepared in cooperation with City of Inglewood, Calif.

Descriptors: (*Refuse disposal, *Bags), (*Garbage disposal, Bags), Collection methods, Bag papers, Polyethylene, Time studies, Comparison, Efficiency, Benefit cost analysis, Questionnaires, Public opinion, Earthfills, Field tests, Performance evaluation.
Identifiers: *Solid waste disposal, Paper bags, Plastic bags, Sanitary landfills.

The study was conducted to evaluate the suitability of disposable plastic and paper sack materials for use as solid waste containers. Six residential areas in Inglewood, California, were selected; three were to receive bags for test use and the remainder to serve as a control. Bag systems studied included household polyethylene and paper bags on holders, free-standing paper bags and polyethylene can liners as well as large polyethylene commercial bin liners that were distributed to a number of restaurants. Results were obtained by using time and motion studies and this information was reinforced by laboratory testing and by an aggressive questionnaire program. A model of the collection system was then developed and subsequent simulation studies were employed fo r cost analysis. The project demonstrated that bags are quite satisfactory as solid waste container replacements for cans. The most prominent problems, however, were the difficulties in developing efficient bulk storage and distribution methods of the bags.

AIR POLLUTANT EMISSION INVENTORY FOR THE STATE OF NEW HAMPSHIRE.
Summary rept.,
Paul Morgenstern, Josette C. Goldish, and Ronald G. Orner. Jan 72, 48p APTD-1342
Contract EPA-68-02-0049
Prepared in cooperation with New Hampshire Air Pollution Control Agency, Concord.

Descriptors: (*Air pollution, *New Hampshire), Urban areas, Sources, Inventories, Tables (Data), Particles, Sulfur dioxide, Nitrogen oxides, Natural gas, Solvents, Hydrocarbons, Carbon monoxide, Combustion products, Exhaust gases, Fuels, Transportation, Industrial wastes, Coal, Fuel oil, Evaporation, Waste disposal, Demography, Electric power plants, Waste disposal, Incinerators.
Identifiers: *Air quality data, Implementation Air Pollution Planning Program, Solid waste disposal, Air Quality Control Regions, Open burning, Automobile exhaust.

A summary is presented of the results from an inventory of air pollutant emissions within the State of New Hampshire. The contaminants considered included sulfur oxides, carbon monoxide, nitrogen oxides, hydrocarbons, and particulates. Estimates of the annual emission of the pollutants were developed for the year 1970 and are summarized. The emissions within each of these Regions are summarized by source type. The methodology for preparing the inventory consisted of first determining the consumption of fuels according to combustion sources for power, space heating, and other industrial process needs. The emission of pollutants arising from this set of sources is estimated by the application of appropriate emission factors in conjunction with selected fuel composition. For the case of particulate emissions, the factors also take cognizance of the reduction affected by existing installed control devices. (Author)

Contract CPA-70-149

Descriptors: (*Air pollution, Fly ash), (*Electrostatic precipitation, *Fly ash), Injection, Conditioning (Treating), Electrical resistance, Sulfur trioxide, Sulfuric acid, Ammonia, Cost estimates, Electric power plants, Flue gases, Particles, Combustion products.
Identifiers: *Air pollution control.

An experimental study was made of the injection of SO3 or H2SO4 gaseous conditioning agent to alleviate the problem of high electrical resistivity of fly ash. This problem interferes with the electrostatic precipitation of fly ash in power stations burning low-sulfur coals and thus providing very low concentrations of H2SO4 as a naturally occurring conditioning agent. Experimental measurements included in the study consisted of determinations of fly-ash resistivity in situ and analyses of coal, flue gases, and fly ash with injected SO3 and H2SO4 concentrations up to 50 ppm. For comparison with conditioning by injected SO3 and H2SO4, a parallel study was made of conditioning by H2SO4 as produced naturally during the burning of coal. To compare the economic aspects of different processes of SO3 and H2SO4 injection, an analysis was made of the various capital and operating costs in existing injection facilities. NH3 was studied as a means of coping with poor precipitator efficiency in a power station burning a high-sulfur coal and thus producing an undesirably high concentration of H2SO4.

JOINT AIR POLLUTION STUDY OF ST. CLAIR - DETROIT RIVER AREAS FOR INTERNATIONAL JOINT COMMISSION CANADA AND THE UNITED STATES.

Jan 71, 267p APTD-1305

Descriptors: (*Air pollution, *Michigan), (*Canada, Air pollution), Inventories, Sources,

Tables (Data), Sulfur dioxide, Particles, Odors, Demography, Meteorological data, Oxidizers, Trace elements, Metals, Pyrenes, Fluorides, Hydrogen sulfide, Carbon monoxide, Hydrocarbons, Nitrogen oxides, Atmospheric corrosion, Combustion products, Exhaust gases, Industrial wastes, Waste disposal, Atmospheric diffusion, Cost estimates, Transportation, International relations.
Identifiers: *Air quality data, Air pollution effects (Plants), Benzopyrenes, Air pollution effects (Materials), Detroit (Michigan), Port Huron (Michigan), Saint Clair County (Michigan), Macomb County (Michigan), Oakland County (Michigan), Wayne County (Michigan).

As a result of a request, by the City of Windsor, that action be taken to abate the flow of transboundary-pollution emanating from the industrial complex in Wayne County, Michigan, the Governments of Canada and the U.S. initiated an investigation. During this investigation of the air pollution, the following work was undertaken: Air quality measurements were made; Odorous pollutants were investigated; Meteorological measurements were taken; An inventory of atmospheric emissions was made of pollutants emanating from all sources; and A study of the effects of air pollutants in the area on selected vegetation and materials was conducted. The report describes the methods of evaluation and presents the results and conclusions.

STUDY OF FACTORS AFFECTING REACTIONS IN ENVIRONMENTAL CHAMBERS.
Final rept. on Phase 1,
Raphael J. Jaffe. 20 May 72, 113p LMSC-A997745 CRC-APRAC-CAPA-1-69-1
Contract EPA-68-02-0038

Descriptors: (*Photochemical reactions, Test chambers), (*Air pollution, Photochemical reactions), (*Smog, *Test chambers), Design criteria, Simulators, Surface properties, Exhaust gases, Xenon lamps, Cleaning, Gas analysis, Chemical analysis, Nitrogen dioxide, Nitrogen oxide (NO), Ozone, Hydrocarbons, Aldehydes, Photolysis.

The report presents results of factors affecting environmental chambers used to study photochemical reactions in the lower atmosphere. Described are the facilities, the chamber, the light source, and some photochemical reactions. The work has shown the practicality of operating an environmental chamber externally illuminated by a collimated beam of light from an xenon arc lamp. It has also demonstrated that a vacuum chamber pumpdown of the environmental chamber is a feasible method of chamber cleaning. Analytical chemistry methodology has been demonstrated for the photochemical reaction products of interest.

SAMPLING OF GLACIAL SNOW FOR PESTICIDE ANALYSIS,
Water pollution control research series,
T. R. Stengle, J. J. Lichtenberg, and C. S. Houston. Feb 71, 25p W71-10675, EPA-WQO-16020-GAG-02/71
Prepared in cooperation with the Vermont Univ., Burlington. Dept. of Community Medicine.
Paper copy available from GPO $0.35 as EP1. 16026-GAG-0271.

Descriptors: (*Pesticides, *Glaciers), Chlorine aromatic compounds, DDT, Snow, Sampling, Chemical analysis, Contamination, Alloy steels, Boron, Cadmium, Chromium, Iron, Water pollution, Sources.
Identifiers: Biphenyl/chloro.

Snow samples were taken from the plateau glacier of Mt. Logan, Y. T., Canada during an investigation intent on demonstrating the feasibility of taking such samples from high altitude snowfields for pesticide analysis and developing sampling techniques devoid of contamination. Samples were also taken at a depth of 15 m to determine whether DDT concentration varied with the age of the snow. Pesticide analyses were performed using vapor phase chromatographic techniques. DDT was not detected within the limit of detectability (5 ng/l). Over half the samples were contaminated with PCB's which raised the detectability limit to 10-50 ng/l. The PCB contamination is believed to have come from the sampling auger, as an analysis of rinsings from it seemed to confirm. A sample taken from a depth of 1.5-2.5 m was acidified with distilled nitric acid, when thawed, and analyzed for19 elements simultaleously using a direct reading emission spektrometer. Four elements were detected: boron at 4 ng/ml, cadmium at . ng/ml, chromium at 2 ng/ml, and iron at 47 ng/ml. The high levels of cadmium and especially iron suggest contamination from the alloy steels of the auger.

Descriptors: (*Waste disposal, *Materials recovery), (*Metal industry, Materials recovery), (*Paper industry, Materials recovery), (*Textile industry, Materials recovery), Utilization, Scrap, Metal scrap, Waste papers, Textiles, Industries, Marketing, Demand (Economics), Supply (Economics), Economic factors, Aluminum, Copper, Lead, Zinc, Nickel, Stainless steel, Precious metals.
Identifiers: *Solid waste disposal, *Waste recycling, *Metal recycling, *Secondary materials industry, Scrap recycling, Junk car disposal.

The study concerns the development of greater solid waste utilization through analysis of the secondary materials industry, its sources of supply, its consuming markets, and its economic and technological problems. Eight separate materials examined are aluminum, copper, lead, zinc, nickel and stainless steel, precious metals, paper, and textiles. Problems inhibiting increased recycling of these materials are identified, and recommended actions are proposed. A survey of the secondary materials industry was the basis for many of the identified problems and also provided numerous statistics on the scrap industry. Volume 1 provides a brief summary of the other 8 volumes, plus an analysis of activities and recycling problems common to all of the commodities. Areas of commonality include such matters as legislation and its effect on recycling, and a description of the equipment used in processing secondary materials.

EFFECTS OF AIR POLLUTION ON PUBLIC ATTITUDES AND KNOWLEDGE.
Final rept.,
Robert G. Mason. Jun 72, 151p* EPA-R5-72-007
Contract CPA-70-117

Descriptors: (*Air pollution, *Communications management), (*Public opinion, Air pollution), Attitude surveys, Information, Education, Sociometrics, Mass communication, Management methods, Mathematical models, Visibility, Variability, Government policies, Interviews, Oregon.
Identifiers: *Public information dissemination, Air pollution abatement, Willamette Valley.

The report presents the results of testing a public information model in which attitudes toward and knowledge about air quality play a role. First, the linkage between public attitudes and Government action is discussed. Research efforts tested a hypothesis concerning the relationship between mass media content and attitude change. Second, environmental conditions which may have a bearing on variables in the model are considered. Three variables were considered to be mutually interdependent and were considered endogenous. These were: attitude toward air quality; mass media exposure to information about air quality; and level of air quality knowledge. Variables considered exogenous were: levels of interpersonal discussion; social influence; levels of formal and science education; and use of the environment for recreation purposes. Finally, a theoretical model concerning the acquisition and processing of air quality information, by people, was formulated and tested. (Author)

IN-STACK TRANSMISSOMETER TECHNIQUES FOR MEASURING OPACITIES OF PARTICULATE EMISSIONS FROM STATIONARY SOURCES,
Carl M. Peterson, and M. Tomaides. Apr 72, 87p* EPA-R2-72-099
Contract EPA-68-02-0309

Descriptors: (*Flue gases, Transmissometers), (*Smoke, *Transmissometers), (*Air pollution, Smoke), Field tests, Plumes, Electric power plants, Performance evaluation, Opacity, Transmittance, Detectors, Light scattering, Chimneys, Monitors, Design, Particles.
Identifiers: *Air pollution detection.

Field studies were conducted to obtain basic research data as a base for developing design and performance specifications for transmissometers which are to be used to measure smoke stack plume opacities. Tests, conducted on the stack of a pulverized coal-fired power plant, were designed to evaluate the influence of transmissometer illumination and light receiving angles, and transmitted light wavelength on in-stack opacity measurements and their correlation with the stack plume opacity. Two specially-designed transmissometers, one having a small fixed illumination-viewing angle design and the other having adjustable illumination and viewing angles, were mounted on a cylindrical 145-inch diameter steel stack to measure the in-stack opacity. A 0.5 deg telephotometer was used to determine the out-of-stack opacity of the plume as viewed from a distant river bank. The report contains a description of the transmissometers employed in the study, the experimental test program applied, and the results achieved. (Author)

TOXICOLOGY OF ATMOSPHERIC SULFUR DIOXIDE DECAY PRODUCTS,
Trent R. Lewis, Mary O. Amdur, Martin D. Fritzhand, and Kirby I. Campbell. Jul 72, 47p* AP-111

Descriptors: (*Air pollution, Sulfuric acid), (*Sulfuric acid, *Toxicology), (*Particles, Toxicology), (*Sulfur dioxide, Air pollution), Mist, Aerosols, Lethal dosage, Animals, Humans, Public health, Respiratory diseases, Particle size, Sulfates, CNS disorders, Senses, Physiology, Central nervous system, Dark adaptation, Electrophysiology, Conditioned responses.
Identifiers: *Air pollution effects (Animals), Optical chronaxy.

Studies of atmospheric chemistry have shown that under certain conditions sulfur dioxide can be converted to sulfuric acid and particulate sulfates. Air quality criteria and standards for sulfur dioxide should, therefore, take into account the irritant potency of these oxidation products, recognizing that both sulfur dioxide and its degradation products can react further with other air pollutant constituents. The document reviews toxicity studies conducted in experimental animals, and toxicity studies involving human subjects. The data presented on animal studies examines the effect of sulfuric acid mist particle size and exposure duration on mortality and pathology studies. It also reviews the findings of related studies of pulmonary function. The review presents, from human studies, data which discusses subjective and physiological responses to irritative properties of sulfuric acid mist, and sensory and central nervous system responses to sulfuric acid mist. SANTA BARBARA OIL SPILL: SHORT-TERM ANALYSIS OF MACROPLANKTON AND FISH.
Water pollution control research series.

Feb 71, 72p EPA-15080-EAL-02/71
Contract EPA-14-12-534
Paper copy available GPO $0.70 as stock no. 5501-0100.

Descriptors: (*Water pollution, *Marine biology), Oils, California, Pacific Ocean, Ecology, Seasonal variations, Climatology, Fishes, Shrimps, Fisheries, Plankton, Biological surveys.
Identifiers: *Oil pollution, *Water pollution effects (Animals), Oil spills, Santa Barbara (California).

Deep and shallow macroplankton from the Santa Barbara Channel area of the 1969 oil spill and from the Santa Cruz Basin further offshore were compared with others from previous years to study oil damage. Spring and summer collections from nearshore bottom communities of fishes and large invertebrates around kelp beds near the blowout area were compared with collections made prior to the spill and another area. No noticeable fish kills followed the blowout. Most observed changes, apparently unrelated to the spill, corresponded with various climatic anomalies during March through August, 1969. After the blowout, the composition and mode of the Channel Island sport fishery changed with seasonal trends and probably not as a direct effect of the spill. Only the temporary disappearance of tiny mysid shrimps inhabiting the kelp canopy was a likely direct effect.

EVALUATION OF DIESEL SMOKE INSPECTION PROCEDURES AND SMOKEMETERS.
Final rept.,
John O. Storment, and Karl J. Springer. Jul 72, 163p* SwRI-AR-835 APTD-1351
Contract EPA-EHS-70-109

Descriptors: (*Smoke, Detectors), (*Air pollution, Smoke), (*Diesel engines, Smoke), (*Exhaust gases, Diesel engines), Particles, Tests, Opacity, Performance evaluation, Light transmission, Buses (Vehicles), Motor trucks, Calibration.
Identifiers: *Motor vehicle inspection, Smokemeters.

Various vehicle smoke test procedures, smokemeters, and smoke opacity measurement techniques were evaluated by comparison to well known standards. The test procedures were compared to a chassis-dynamometer version of the Federal smoke compliance test. The performance of six commercial smokemeters was compared to that of the standard PHS smokemeter. Also, end-of-line and inline opacity measurements were evaluated by using an inline version of the PHS smokemeter. The smoke test procedures investigated showed varying degrees of correlation with the simulated Federal smoke test, but no one procedure produced data that correlated with the Federal test in every test instance. Other investigations were also conducted: Two enlarged versions of the PHS smokemeter were tested and showed good agreement with the standard unit. Three standard PHS instruments were used in a series of repetitive smoke tests and exhibited excellent agreement.

Descriptors: (*Odor detection, Reviews), (*Air pollution, *Odors), (*Gas analysis, Odor detection), Industrial wastes, Sources, Agricultural wastes, Gas detectors, Instruments, Gas chromatography, Colorimetric analysis, Chemiluminescence, Infrared spectroscopy, Bioluminescence, Spectroscopic analysis, Sulfate pulping, Petroleum refining, Paper industry, Aldehydes, Hydrogen sulfide, Thiols, Organic sulfides, Sulfate pulping, Monitors, Amines, Sulfur dioxide.
Identifiers: Coulometric titration, *Air pollution detection, Rendering plants, Manure, Petrochemical industry.

A state-of-the-art review was made to collect and evaluate information on the instrumentation available to measure the quantities of specific odorants in industrial plant emissions. Its object is to examine the possibility of substituting a quantitative measurement of odorants for the subjective measurement of odors as a guide for the control of odorous emissions. The review presents background information for the basic definitions of the problem of odorant emission measurements, and the types of instrumentation available. Details are given of the three industries considered as odorant sources. Information is given on specific instruments which are commercially preferred, or available alternates, or potential alternates where further development is required. (Author)

Contract EPA-68-04-0001

Descriptors: (*Gas turbine engines, *Exhaust gases), (*Air pollution, Exhaust gases), Static tests, Test facilities, Turbojet engines, Design criteria, Monitors, Gas detectors, Carbon monox-

ide, Nitrogen oxide (NO), Hydrocarbons, Temperature measurement, Air flow.
Identifiers: J-33 engines, Jet engine exhaust.

A gas turbine combustion facility was designed and constructed. After a review and description of the combustion facility, results are presented which include gas temperature, carbon monoxide, and nitric oxide concentration profiles as a function of axial and radial position inside an Allison J-33 combustor. In addition some combustor exit plane measurements are reported. Specifically, the isolated effects of combustor pressure, overall equivalence ratio, and air flow rate on CO and NO concentration at various radial positions are investigated. These results are qualitatively explained in terms of basic combustor processes. Unheated combustor inlet air was used for the above studies; a few preliminary experiments using heated air are also described. (Author)

DEVELOPMENT OF THE AQUEOUS PROCESSES FOR REMOVING NOX FROM FLUE GASES,
Gilford A.Chappell. Sep 72, 212p* EPA-R2-72-051
Contract EPA-68-02-0220

Descriptors: (*Air pollution, Nitrogen oxides), (*Adsorption, *Nitrogen oxides), (*Flue gases, Adsorption), Adsorbents, Water, Hydroxides, Ammonia, Ethanolamine, Acid treatment, Salt water, Adsorptivity, Solutions, Scrubbers, Limestone, Combustion products, Carbonates, Calcium carbonates, Calcium hydroxides.
Identifiers: *Air pollution control, *Alkaline scrubbing, Ammonia scrubbing, Limestone scrubbing.

A screening study was conducted to evaluate the capability of aqueous solutions to scrub NOx from the flue gases emitted by stationary power plants fired with fossil fuels. The report summarizes the findings of this laboratory program. The experimental program studied the following media for absorption of NOx from flue gases containing no NOx: Water; Metal hydroxides and slurries; Ammonia and 2-aminoethanol solutions; Acid solutions; and Salt solutions. In the scrubbing of flue gas containing NO2 and SO2, absorption of NO2-SO2 by sulfites, hydroxides, and carbonates was studied. Combined NOx-SOx scrubbing seems feasible using any of several hydroxide or carbonate systems provided NOx (NO) can be efficiently oxidized to NO2 upstream from the scrubbing unit. (Author)

EPA-R2-72-067

Descriptors: (*Nitrogen oxides, *Gas analysis), (*Air pollution, Nitrogen oxides), Gas sampling, Lead oxides, Chemisorption, Inorganic nitrates, Electrodes, Precipitation (Chemistry), Field tests, Samplers.
Identifiers: *Air pollution detection, Ion selective electrodes.

The current manual NO (x) sampling and analysis method was evaluated. Improved time-integrated sampling and rapid analysis methods were developed. In the new method, the sample gas is drawn through a heated bed of uniquely active, crystalline, PbO2 where NO (x) is quantitatively absorbed. Nitrate ion is later extracted with water and the concentration subsequently determined by a NO3 (-) selective ion electrode. A simple selective precipitation eliminates electrode interferences derived from PbO2 absorption of other combustion products such as HCl, SO (x), HF, and CO. Field tests were conducted at various stationary source sites and the data is presented herein. (Author)

Identifiers: *Air pollution control, *Limestone injection, Waste gas recovery, Sulfur containing fuels.

The effectiveness and economics of fluidized bed combustion boilers in pollution abatement and steam/power generation have been evaluated. A 250,000 lb/hr coal-fired, factory-fabricated, industrial boiler has been designed along with all of its auxiliaries. Utility boilers have also been designed. Overall capital and operating costs have been estimated for both 300 and 600 megawatt plants. The pressurized fluidized bed combustion boiler operating in a combined cycle power plant appears most effective in meeting projected emission standards and in reducing total SO2, NOx, and particulate emissions, and most economical in power generation. A fluidized bed oil gasification-desulfurization system has also been designed and evaluated as an add-on unit for reducing SO2 emissions from utility boilers burning high-sulfur oils. The estimated capital cost of such a unit is presented.

Descriptors: (*Diatoms, *Ecology), Taxonomy, Iowa, Water, Hardness, Pollen, Peat, Swamps, Lakes, Rivers, Streams, Ponds, Water pollution, Indicator species, Algae, Paleobotany.
Identifiers: Eutrophication.

Diatoms comprise the major group of algae in Iowa waters. Their ecological significance, important in pollution evaluation studies, cannot be fully appreciated without a thorough knowledge of their taxonomy. A scale for abundance rating was used giving at least a rough estimate if data permitted. The names of 50 diatom genera occurring in Iowa are listed and for each genus, the number of taxa in the master list and the number in the 'more common' list are presented. A pollen analysis is tabulated; the samples in this analysis extended through 35 ft. of sediment to the postglacial interface at Little Miller's Bay, Lake West Okoboji. Dating was conducted by the radiocarbon technique for samples taken between 34 ft. and 35 ft. in the sediment core. Since this level had the maximum spruce pollen concentration and the pollen percentage decreased progressively above this level, it was considered as the postglacial interface. Some interesting problems lie in consideration of those diatoms which have disappeared from the original lake flora and those which have become common only since the middle of the postglacial period.

Identifiers: *Thiobacillus ferrooxidans, *Mine acid drainage, Oxidase/sulfite, Sulfur transferase/thiosulfate, Pyrophosphatases, Dehydrogenase/glucose-6-phosphate, *Water pollution control, Enzyme activity.

Sulfur metabolism of Thiobacillus ferrooxidans and rhodanese-sulfite oxidase enzymes were studied. As disclosed by electron microscope examination, the purified cell envelope of lipopolysaccharide contains a very high quantity of ferric iron. A new colorimetric whole cell assay was developed to study iron oxidation. The presence of pyrophosphatase enzyme was revealed for the first time in chemolithotrophic microorganisms. Study of energy sources disclosed that the chemolithtrophic T. ferrooxidans can evolve heterotrophic mechanisms and grow on glucose, following the Entner-Doudoroff pathway. (Author)

Contract CPA-70-95
See also Volume 2, PB-213 017.

Descriptors: (*Scrubbers, Reviews), (*Air pollution control equipment, Scrubbers), Handbooks, Patents, Mass transfer, Particles, Water impingment, Performance evaluation, Cost analysis, Design criteria, Construction materials, Waste disposal, Column packings, Particle size, Flue gases, Industrial wastes, Drops, Theories, Bubbling, Contacting, Chemical engineering, Mineral industry, Chemical industry, Metal industry, Food processing.
Identifiers: Air pollution control, Solid waste disposal.

The various aspects of scrubber use and present engineering design methods are reviewed. Actual experience on hundreds of scrubber installations in various industries is presented in a condensed form. Many related topics such as auxiliaries, materials of construction, physical and chemical data, cost estimation and optimization techniques, and disposal of liquid and solid wastes are covered. SPECIFIC METHOD FOR THE DETERMINATION OF OZONE IN THE ATMOSPHERE.
Final rept.,
Sham L. Sachdev, J. P. Lodge, Jr., and Philip W. West. Jan 72, 14p EPA-R3-72-015
Contract CPA-22-69-100

Descriptors: (*Ozone, *Gas analysis), (*Ozonization, *Alkene compounds), (*Air pollution, Ozone), Formaldehyde, Impurities, Phenols, Oxidizers.
Identifiers: *Eugenol, *Air pollution detection.

A description is given of work undertaken to develop a simple, specific, and reliable method for ozone. Reactions of ozone with several 1-alkenes were studied at room temperature (25C). Eugenol (4-allyl-2-methoxy phenol), when reacted with ozone, was found to produce relatively large amounts of formaldehyde as compared to other 1-alkenes tested. The method described was compared with alkaline iodide method for the determination of various concentrations of ozone in the range of 0.05 to 2.0 ppm. The reactions of ozone with eugenol were found to yield stoichiometric amounts of formaldehyde. Hydrogen peroxide, peracetic acid, sulfur dioxide and various reducing agents commonly present in the air, do not interfere with the method. Formaldehyde when present in the air, must be determined simultaneously. Any formaldehyde monitoring equipment can be easily adopted for the determination of ozone. (Author)

USE OF LATEX AS A SOIL SEALANT TO CONTROL ACID MINE DRAINAGE.
Water pollution control research series.
Jun 72, 89p EPA-14010-EFK-06/72, W73-01594
Paper copy available from GPO $1.00 as EP1.16:14010EFK06/72.

Descriptors: (*Water pollution, Mine waters), (*Mines, Sealing), Latex, Feasibility, Particle size, Field tests, Permeability, Soil properties, Biodeterioration, Styrene butadiene resins, Coal mines, Waterproofing, Cost estimates.
Identifiers: *Soil sealants, Water pollution abatement, *Mine acid drainage, Surface sealing.

Acid formation in a mine cavity can be prevented by keeping water (one of the reactants) out of the mine. This might be accomplished by forming a waterproof seal over the mine cavity to prevent the seepage of surface water into the mine. In laboratory tests using reconstructed soil columns, rubber latex showed good sealing efficiency. The ideal situation in which latex would coagulate in a narrow zone two to three feet below the surface by reacting with acidic or metallic constituents of the soil was not attained. Rather, in field tests the latex was deposited progressively. Latex stability appears to be a more critical property than latex particle size in controlling penetration. Addition of excess anionic surfactants to latex improved its penetration into the soil. Costs are discussed.

Water Pollution Control Federation, Washington, D.C.
RESEARCH SUPPLEMENT TO JOURNAL - WATER POLLUTION CONTROL FEDERATION.
Water pollution control research series.

Jun 71, 33p W73-01635, EPA-16090-DQZ-06/71
Paper copy available from GPO $0.45 as EP1.16:16090DQZ06/71.

Descriptors: (*Water pollution, *Periodicals), Failure, Publicity, Acceptability, Attitude surveys, Questionnaires, Research, Project planning, Cost analysis, Publishing.

Discussed is the publication of a quarterly research supplement to Journal Water Pollution Control Federation with federal grant support. This was carried out from October 1967 to August 1970 and was an experimental effort to determine the feasibility of such a publication in developing its own self-sustaining support as an effective and economical means of disseminating research information to the water pollution control field. The 12 issues published in the three-year grant period proved to be an effective means of such dissemination and demonstrated an excellent method of creating a permanent, retrievable source of pertinent information. The project was not successful economically in that advertising and other revenues did not reach anticipated goals. The project was terminated in August 1970 at the end of the grant period. (Author)

CONCENTRATED MINE DRAINAGE DISPOSAL INTO SEWAGE TREATMENT SYSTEMS.
Sep 71, 81p W73-01639, EPA-14010-FBZ-09/71
Paper copy available from GPO $0.75 as stock no. EP1 16:14010-FBZ-09/71.

Descriptors: (*Sewage treatment, *Brines), (*Mine waters, Sewage treatment), Waste disposal, Iron, Osmosis, Inorganic phosphates, Activated sludge process, Sludge digestion, Precipitation (Chemistry), Design, Cost estimates, Biochemical oxygen demand.
Identifiers: *Mine acid drainage, Liquid waste disposal, Nitrification, Denitrification, Chemical oxygen demand.

Studies were undertaken on a small scale to determine the effect liquid waste artificial iron-rich acid brines had on municipal sewage treatment

processes. The brines were devised to simulate concentrates from treatment of acid mine drainage. At very high concentrations, the brines neutralized with lime give virtually complete removal of phosphate from primary effluent, activated sludge effluent, or anaerobic sludge digester decantate. The cost of the iron-rich acid brine produced from acid mine drainage by the reverse osmosis membrane treatment is estimated. Costs of transportation by rail, truck, and pipeline are also shown. DEPOSITION OF FINE SEDIMENTS IN TURBULENT FLOWS.
Emmanuel Partheniades, and Ashish J. Mehta.
Aug 71, 44p W73-01567, EPA-16050-ERS-08/71
Paper copy available from GPO $0.50 as stock no. EP1.16:16050 ERS 08/71.

Descriptors: (*Sediments, Deposition), (*Sediment transport, Turbulent flow), Suspended sediments, Shear stress, Clays, Silts, Sedimentalogy, Drag, Open channel flow.

Deposition of fine cohesive sediments in a turbulent flow field was studied in a system of a rotating annular channel and ring. The percentage of the total sediment that a given flow can maintain in suspension depends only on the bed shear stress and is independent of the initial sediment concentration. The percentage (C) of the depositable sediment deposited at time t has been found to vary with time according to the law C±a log t + b, where the coefficient a is independent of the flow conditions and sediment concentration, while the coefficient b is a function of the bed shear stress only. Both a and b depend on the physicochemical properties of the sediment and the water environment. Deposition rates are proportional to the depositable sediment concentration and inversely proportional to time. (Author)

WINTER SURVIVAL OF FECAL INDICATOR BACTERIA IN A SUBARCTIC ALASKAN RIVER,
R. C. Gordon. Aug 72, 46p W73-01507, EPA-R2-72-013
Paper copy available from GPO $0.50 as EP1.23/2: 72-013.

Descriptors: (*Water pollution, Coliform bacteria), (*Coliform bacteria, Cold tolerance), (*Feces, Water pollution), Water quality, Indicator species, Enterobacteriaceae, Organic waste, Water chemistry, Arctic regions, Hydrology, Alaska, Rivers.

Survival of fecal indicator bacteria in a subarctic Alaskan river was studied during the winter of 1969-70 when there was total ice cover and the water temperature was 0 deg C. Most of the domestic pollution entered the river from one source. Since no additional pollution entered downstream from this source, an uninterrupted study covering 7 days of flow (210 river miles) was possible. Nine sample stations were established to obtain total coliform, fecal coliform, enterococcus and water chemistry data. Samples were collected four to eight times from each station during the 2-week period of data collection, and a discharge measurement was made at each station during the same period. Bacteria survival was examined with and without consideration for the effect of dilution. After 7 days flow time, total coliforms were reduced to 3.2-6.5 percent of the initial count, fecal coliforms to 2.1-4.2 percent, and the enterococci to 18.1-37.3 percent depending on dilution consideration.

FLOW INTO A STRATIFIED RESERVOIR,
William M. Thurston. Aug 72, 67p* W73-01570, EPA-R2-72-037
Paper copy available from GPO $0.65 as EP1.23/2: 72-037.

Descriptors: (*Reservoirs, Currents), (*Environmental engineering, Reservoirs), Hydraulic jump, Water intakes, Water pollution, Water quality, Hydrodynamic models, Dynamic tests, Flow visualization, Flow measurement, Mathematical prediction.
Identifiers: Stratified flow, Stratified reservoirs.

The flow caused by a line source discharging into a stagnant, linearly density stratified reservoir was studied in a tank. The flow enters the reservoir as a horizontal line jet but immediately passes through an internal hydraulic jump and forms a slowly moving wedge of fluid mixed into the injection by the jump. The inflow also induces a series of layers of flow in alternating directions above and below the entering layer. The mixed layer was made visible by mixing blue dye into the supply fluid. The length, thickness, and tip speed of the mixed layer were measured as a function of time, and an empirical scaling relationship was derived. The results may be used to predict the extent of mixed layers which might occur during the pumping phase in a jump-storage reservoir.

FOREST FERTILIZATION (A STATE-OF-THE-ART REVIEW AND DESCRIPTION OF ENVIRONMENTAL EFFECTS),
William A. Groman. Aug 72, 62p* W73-01638, EPA-R2-72-016
Paper copy available from GPO $0.65 as EP1.23/2: 72-016.

Descriptors: (*Forestry, *Fertilization), (*Water pollution, *Fertilizers), Reviews, Water quality, Forest land, Trends, Socioeconomic status, Trees (Plants), Nutrients, Hydrology, Nitrogen, Surface water runoff, Limnology, Europe, United States.
Identifiers: *Water pollution effects (Plants), Forest management.

The application of chemical fertilizers to forest soils for site amelioration is one of the newest and most promising methods for increasing production. Concern has risen over possible toxic and eutrophic effects of fertilization on water quality. Data was assembled on the scope and trends of the practice throughout the world in order to determine the extent of actual or potential detrimental effects of forest fertilization, and to evaluate priority for grants. Results of completed forest fertilization-water quality studies are summarized and evaluated, and the status of current water quality studies in described. Recommendations are given for reviews and new research efforts. (Author)

IN-SEWER FIXED SCREENING OF COMBINED SEWER OVERFLOWS.
Oct 70, 150p W73-01774, EPA-11024-FKJ-10/70
Contract EPA-14-12-180
Paper copy available from GPO $1.25 as stock no. EP1.16:11024-FKJ-10/70.

Descriptors: (*Combined sewers, *Sewage filtration), Particle size, Surface water runoff, Overflows, Chlorination, Performance evaluation, Size screening, Biochemical oxygen demand, Oils, Rainfall intensity, Correlation, Greases, Bacteria, Design, Engineering drawings.
Identifiers: Storm water runoff.

Field sampling and measuring were conducted in conjunction with laboratory investigations on the characterization of combined sewage and the effects of solids removal on chlorination practices. Sixty combined sewage bulk samples and 60 combined sewage screenings samples retained on screens of 0.125-, 0.25-, 0.5-, and 1.0 in. aperture were analyzed and evaluated. Removals of deoxygenating materials, oils and greases, and bacteria by fixed screens placed in combined sewers were marginal. Reductions in chlorine requirements as a result of prior solids removal by fixed screening appear small. Screens with aperture sizes ranging from 0.0164 to 1.0 in. appear to have very little effect on bacterial concentrations. (Author)

Charles W. Hendricks. Dec 71, 110p W73-01783, EPA-16050-EQS-12/71
Paper copy available from GPO $1.00 as stock no. EP1-16:16050-EQS-12/71.

Descriptors: (*Water pollution, *Bacteria), (*Water quality, Bacteria), (*Aquatic microbiology, *Enterobacteriaceal), Nutrients, Sediments, Derritus, Salmonella, Shigella, Adsorption, Cultures (Biology), Public health, Georgia, Metabolism.
Identifiers: Water pollution effects (Plants), Pathogenic bacteria, Oconee River.

To relate basal nutrients in the water and on the bottom of a warm, fresh water stream to their ability to support growth and multiplication of pathogenic and nonpathogenic enteric bacteria, three studies were designed including a river water quality analysis, respiration experiments, and continous culture experiments. The presence of coliform bacteria primarily not producing intestinal disease, serves as indicators for potentially infectious microorganisms. Any growth by either coliform bacterial group or the disease producing organisms in the natural aquatic environment could significantly alter our present concepts of detection and surveillance of these organisms. Tests in detecting and analyzing polluted waters, and from levels of the self-purification potential, showed that Oconee River, a typically non-polluted stream of the North Georgia piedmont, is capable of supporting bacterial growth including coliforms. PURIFICATION OF MINE WATER BY FREEZING.
Water pollution control research series.

Feb 71, 65p W73-01817, EPA-14010-DRZ-02/71
Paper copy available from GPO $0.70 as EP1.16:14010DRZ02/71.

Descriptors: (*Mine waters, *Freezing), (*Water pollution, Mine waters), Metals, Acids, Iron inorganic compounds, pH, Coal mines, Calcium oxides, Sulfates, Purification.
Identifiers: *Water pollution control, *Mine acid drainage.

Partial freezing of acid mine water was used to the extent of 50% conversion to ice. Various metal and acid components in the product water were consistently reduced 85 to 90%. Acid mine water that had been treated with lime was used in similar freezing experiments and observed to have a reduction of metal ions. The pH remained substantially unchanged and the hardness of the water was reduced by nearly 100%. Considerable variations resulted even with efforts toward good control and reproducibility of operation. A firm conclusion as to reduction of sulfate and reduction of certain individual metals was prevented because of difficulties with analytical results. (Author)

EVALUATION OF CONDITIONING AND DEWATERING SEWAGE SLUDGE BY FREEZING.
Water pollution control research series.

Jan 71, 66p W73-01858, EPA-11010-EVE-01/71
Grant WPRD-71-01-68
Paper copy available from GPO $0.70 as EP1.16:11010EVE01/71.

Descriptors: (*Sludge drying, *Freezing), (*Sewage treatment, Sludge drying), Dewatering, Activated sludge process, Sludge disposal, Cost estimates, Operating costs, Capital costs, Flotation, Wisconsin.
Identifiers: Milwaukee (Wisconsin).

Data was obtained for a direct comparison between the freeze conditioning and dewatering technique and the conditioning and dewatering methods presently employed at Milwaukee, Wisconsin. The laboratory investigation phase resulted in a freeze-conditioning system consisting of the following process elements: Flotation thickening prior to freezing, Freezing in thin sheets, Thawing of the frozen product, and Dewatering of the thawed sludge. The objective of the engineering design phase was the development of a freeze-conditioning system to handle three tons dry solids per day of activated sludge. Although the freeze conditioning concept, from a technical standpoint, has definite merit as a sludge conditioning process, the equipment capital costs, operating costs, and space requirements are appreciably greater for the freeze conditioning process than for the present chemical conditioning method. CHEMICAL RESPONSES BY MARINE ORGANISMS TO STRESS. STRESS IN HARD CLAMS FROM A POLLUTED ESTUARY,
H. Perry Jeffries. Dec 71, 30p W73-01975, EPA-R3-72-017

Descriptors: (*Aquatic animals, Water pollution), (*Clams, Water pollution), Petroleum products, Organic wastes, Estuaries, Water chemistry, Amino acids, Taurine, Carbohydrates, Glycine, Hydrocarbons, Ecology, Mortality, Shellfish, Biochemistry.
Identifiers: Mercenaria mercenaria, Water pollution effects (Animals), Oil pollution.

The hard clam, Mercenaria mercenaria, shows a general response to environmental variation. The molar ratio of free taurine to glycine in gill and mantle tissues climbs above 3, while alpha-amino acids and carbohydrates decrease. Subtle adjustments in the total pattern of free amino acids and fatty acids also occur, but these can be readily seen by changes in biochemical diversity and equitability. In an estuary long suffering from hydrocarbons and other agents in petroleum products and sewage, high mortality results from a culmination of natural responses superimposed on abnormal complications. The process apparently starts after a black, polymeric irritant collects in epithelial tissue and eventually occludes the renal sac. This leads, indirectly, to infestations of a parasitic polychaete that is rarely found in hard clams. A syndrome with many facets soon becomes clear, but the situation can be identified and its results predicted by simply observing the responses of taurine and glycine in stressed and normal populations.

Identifiers: *Air pollution abatement, *Hybrid vehicular propulsion, Electromechanical transmissions.

The objective of this program was to develop a high charge rate, high discharge rate lead-acid battery compatible with the requirements of a hybrid heat-engine/electric vehicle. Because the power requirements and charge-discharge profiles for a hybrid-vehicle battery are sufficiently different than those for a conventional lead-acid battery, a development program was undertaken to optimize the lead-acid battery for hybrid-vehicle use. As a result of this program, ten test cells producing specific powers of 150 W/lb for a 75-sec discharge and 204 W/lb for a 20-sec discharge were developed and tested. The achievements under this program included: fabrication of thin, conductive vitreous carbon-epoxy substrates, chemically inert to lead-acid cell environment; a method for applying (pasting) the active material onto the substrate; negative bipolar plates that exceeded the performance target of 2A/sq in (0.3 A/sq cm) at 1.5V for 60 sec. and out performed standard pasted plates. Identifiers: *Laser velocimeters, Air pollution detection.

The report describes the design and development of a short range, laser velocimeter together with the analysis of optical velocity measurement techniques over ranges up to 1500 ft. This laser velocimeter operates on an interference-backscatter principle. It is portable and designed to measure velocities of flowing particle laden gases in power plant ducts or stacks at relatively close ranges. The instrument is composed of a sensing head cabinet and an electronics cabinet. The sensing head incorporates a laser illuminator, beam forming optics and photodetector. The electronics cabinet contains a signal processing circuit, spectrum analyzer, and power supplies for the laser and spectrum analyzer. The design, construction and preliminary testing of the velocimeter are discussed. Also presented is an analysis of optical velocity measuring devices for extended range operation. Three types of optical velocimeters were considered: Doppler shift, interference-fringe; and a reticle velocimeter. (Author)

COST AND EMISSION STUDIES OF A HEAT ENGINE/BATTERY HYBRID FAMILY CAR.

Apr 72, 267p* 21054-6001-RO00 APTD-1355
Contract EPA-68-04-0058

Descriptors: (*Air pollution, Exhaust gases), (*Motor vehicles, *Exhaust gases), (*Automotive transmissions, Design), (*Air pollution control equipment, Automobile engines), Motor vehicle drive systems, Internal combustion engines, Electric batteries, Electric vehicles, Performance evaluation, Cost estimates, Absorbers (Equipment), Catalysis, Hydrocarbons, Desorption, Traps, AC generators, Tests, Weight (Mass).
Identifiers: *Hybrid vehicular propulsion, Automobile exhaust, Electromechanical transmissions, Hydrocarbon accumulators, *Catalytic reactors (Exhaust systems), *Air pollution control, Air pollution abatement.

An experimental and analytical study was conducted. The broad objectives of the studies were as follows: to select and analyze the performance of series and parallel configured heat engine/battery hybrid family cars; to define the relative efficiencies, weight and costs of hybrid power trains; to generate data characteristics of selected three-component catalysts; to perform preliminary materials screening and development of a hydrocarbon emission trap (hydrocarbon accumulator); and to demonstrate that a hybrid car with an internal combustion engine could meet the 1975/76 emission goals. The document describes the work done and presents the results and conclusions. (Author)

BACKGROUND INFORMATION FOR ESTABLISHMENT OF NATIONAL STANDARDS OF PERFORMANCE FOR NEW SOURCES. CASTOR BEAN PROCESSING.

Jul 72, 36p* APTD-1361
Contract CPA-70-165

Descriptors: (*Castor oil, *Refining), (*Air pollution, *Vegetable oils), (*Industrial wastes, Castor oil), Seeds, Beans, Processing, Production engineering, Economic analysis, Particles, Air pollution control equipment, Scrubbers, Incinerators, Aliphatic acid esters, Dust collectors, Demand (Economics).
Identifiers: Castor bean processing, Castor pomace.

Castor oil is one of the more important vegetable oils being used industrially. The report presents background information for this new source of pollutant emission. The following topics are discussed: The economic and statistical background which includes castor oil production facilities; Production methods and processes which include seed handling, castor pomace processing, and oil refining; The uses of castor oil and castor oil products; Industrial emissions which primarily include particulates and emissions from oil refining; and Control technology involving dry particulate collectors, wet scrubbers, adsorption, and incineration. STATE OF THE ART FOR CONTROLLING NOX EMISSIONS, PART I. UTILITY BOILERS,
L. K. Jain, E. L. Calvin, and R. L. Looper. Sep 72, 118p* EPA-R2-72-072a
Contract EPA-68-02-0241

Descriptors: (*Boilers, *Combustion products), (*Air pollution, *Nitrogen oxides), (*Combustion control, Boilers), Reviews, Furnaces, Design criteria, Flue gases, Process variables, Temperature control, Mixing, Combustion efficiency, Combustion chambers, Electric power plants, Cost estimates, Gas burners, Oil burners, Coal.
Identifiers: *Air pollution control.

A report is presented with the objective of identifying the 'State of the Art' of NOx emission reduction from stationary sources through combustion modification. This first part of a two part report deals with the control of NOx from utility boilers. The report presents information on sources of, and formation of nitrogen oxides. A total of five factors which effect utility boiler emissions are discussed in detail. A discussion of 'Combustion Modification for NOx Emission Control', includes the following topics: combustion operating modification, combustion equipment, design modifications, and flue gas treatment. INDUSTRIAL WASTE SURVEY, DADE COUNTY, FLORIDA.
Technical rept.

Sep 71, 108p TS03-71-208-03.1
Prepared in cooperation with Lower Florida Estuary Study, Ft. Lauderdale, Florida.

Descriptors: (*Water pollution, *Florida), Inventories, Industrial wastes, Biochemical oxygen demand, Oils, Water quality, Phenols, Suspended sediments.
Identifiers: *Dade County (Florida), Chemical oxygen demand.

The report presents an inventory of water pollution in Dade County, Florida. The sources, types, and concentration of pollutants are presented.

Descriptors: (*Water pollution, *Spent liquors (Pulping)), (*Escambia River, Water pollution), (*Alabama, Water pollution), Florida, Conecuh River, Industrial wastes, Industrial waste treatment, Water quality, Paper industry.
Identifiers: Brewton (Alabama), Escambia County (Alabama), Santa Rosa County (Florida), Escambia County (Florida).

Container Corporation of America's (CCA) integrated pulp and paper mill at Brewton, Alabama is in the process of increasing pulping capacity from 900 tons per day to 1050 tons per day. Its waste effluent flows into the Conecuh River and then into the Escambia River. Preceding this expansion is the installation of additional secondary waste treatment facilities. During August 17-28, 1970, prior to activating additional waste treatment units, the Southeast Water Laboratory, Technical Services Division, Federal Water Quality Administration, conducted a 10-day investigation of waste treatment facilities and related stream quality conditions. The report presents the results of this study. (Author)

CONTAINER CORPORATION OF AMERICA BREWTON MILL CONECUH-ESCAMBIA RIVER BASIN STUDY II.

Nov 71, 52p
See also PB-213 300.

Descriptors: (*Water pollution, *Spent liquors (Pulping)), (*Escambia River, Water pollution), (*Industrial waste treatment, Spent liquors (Pulping)), (*Alabama, Water pollution), Paper industry, Conecuh River, Industrial wastes, Biochemical oxygen demand, Water quality, Design, Dissolved gases, Oxygen.
Identifiers: Brewton (Alabama), Escambia County (Alabama), Biological industrial waste treatment, Chemical oxygen demand.

The report contains an evaluation of waste treatment at Container Corporation of America's (CCA) Integrated Pulp and Paper Mill located at Brewton, Alabama. The study was designed to determine the volume of carbonaceous waste generated by increased production, evaluate treatment efficiency and qualify any relative changes in water quality in the Conecuh-Escambia River below CCA's discharge.
